## 1. Characterization

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded with a JEOL ECS-400 NMR spectrometer operating at 400 MHz using a tetramethylsilane (TMS) as an internal reference. Fourier Transfer Infra-red (FT-IR) spectroscopy was conducted with a Thermo Fisher Scientific Nicolet iS10 equipped with an ATR instrument. Matrix-assisted laser desorption/ionization time of flight mass spectroscopy (MALDI-TOF MS) was carried out with a Shimazu Biotech AXIMA Confidence on the reflectron mode. Samples were dissolved in THF containing sodium triacetate and 1,8,9-trihydroxyanthracene (dithranol) as a matrix. Size exclusion column chromatography (SEC) were performed with a Tosoh HLC-8320GPC using DMF as eluents operating at a flow rate of 0.5 mL $\min ^{-1}$. Number averaged molecular mass $\left(M_{n}\right)$, Weight averaged molecular mass ( $M_{w}$ ) and polydispersity ( $M_{\mathrm{w}} / M_{\mathrm{n}}$ ) were determined from SEC traces using polystyrene standards. PAHU films were fabricated by gradual drying of monomer solutions under ambient atmosphere using a Sanso Vacuum Drying Oven SVD10P (width, 20 cm ; depth, 25 cm ; height, 20 cm ). Stress-strain ( $\mathrm{S}-\mathrm{S}$ ) curves of these films were measured with a Shimazu EZ Test EZ-LX with an operation rate of $50 \mathrm{~mm} \mathrm{~min}^{-1}$. PAHU films were cut to dumbbell-shaped plates with a Super dumbbell cuter (DUMBBELL Co., Ltd) and subjected to the measurements according to JISK62517. Tensile strength at a fracture point ( $\sigma_{f}$ ) and elongation at a fracture point ( $\varepsilon_{f}$ ) of the sample films were analyzed with a TRAPEZIUM X software. The tensile tests were performed 3-5 times and then mechanical parameters were averaged.

DPC according to the method that we previously reported. ${ }^{1}$ Other reagents and solvents were used without any purification.

## 3. Syntheses

## 3-1. Synthesis of Ph-DTMP

DTMP 50.0 g ( 200 mmol ) were dissolved in $\mathrm{MeOH}(200 \mathrm{~mL})$. To the solution, benzaldehyde $5.3 \mathrm{~g}(50 \mathrm{mmol})$ and $\mathrm{TsOH} \cdot \mathrm{H}_{2} \mathrm{O} 500 \mathrm{mg}$ ( $2.63 \mathrm{mmol}, 5.3 \mathrm{~mol} \%$ per CHO group) were added and the mixture was stirred at $50^{\circ} \mathrm{C}$ overnight. For neutralization, $\mathrm{NaHCO}_{3} 336 \mathrm{mg}(4.00 \mathrm{mmol})$ was added in the mixture and then stirred at ambient temperature for 30 min . After drying, the resulting solids were dispersed in EtOAc and then insoluble parts were removed by suction filtration. The filtrates were washed three times with water and the organic layer was dried with anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After the solution was concentrated, the resulting solids were purified by silica gel column chromatography ( $n$-hexane/EtOAc volume ratio of $1 / 1$ ). Ph-DTMP including two isomers (cis-Ph-DTMP and trans-Ph-DTMP) were obtained as white solids in $12.3 \mathrm{~g}(72.7 \%)$ yields. These isomers were able to be isolated by reprecipitation from $n$-hexane/EtOAc or silica gel column chromatography.

Tri-Van: To DMF ( 20 mL ) were added Tri-OTs 3.60 g ( 6.00 mmol ), vanillin $4.11 \mathrm{~g}(27.0 \mathrm{mmol}, 1.5$ equiv. per OTs group) and $\mathrm{K}_{2} \mathrm{CO}_{3} 4.90 \mathrm{~g}$ ( 35.5 mmol ). The mixture was stirred at $100^{\circ} \mathrm{C}$ for 3 days and then DMF was removed by vacuum pump. The resulting solids were added in $\mathrm{CHCl}_{3}(100 \mathrm{~mL})$ and the mixture was washed three times with water $(100 \mathrm{~mL})$ followed by saturated NaCl aq. ( 100 mL ). The organic layer was dried with anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and then concentrated by rotary evaporator. The resulting brown solids were purified by silica gel column chromatography ( $\mathrm{CHCl}_{3} / \mathrm{EtOAc}$ volume ratio of $20 / 1$ ). Tri-Van was obtained as a pale yellow solid. ## 3-8. Synthesis of multi-functional DTMPs

Tri-DTMP: Tri-DTMP-Bzz $8.09 \mathrm{~g}(4.35 \mathrm{mmol})$ was dissolved in THF ( 100 mL ). To the solution, $\mathrm{MeOH}(100 \mathrm{~mL})$ was added and then $\mathrm{NaOH} 5.2 \mathrm{~g}(130 \mathrm{mmol})$ dissolving in water $(20 \mathrm{~mL})$ was added. The mixture was stirred at ambient temperature for 1-2 days. ## 3-9. Synthesis of multi-functional DTMP-based 6-CCs

Tri-DTMPC: Tri-DTMP 5.10 g ( 4.13 mmol ), DPC 10.6 g ( $49.6 \mathrm{mmol}, 4$ equiv. per 1,3-diol structure) and $\mathrm{MgCl}_{2}$ 118 mg ( $1.24 \mathrm{mmol}, 10 \mathrm{~mol} \%$ per 1,3-diol structure) were dissolved in DMF ( 40 mL ). LPAHU was synthesized by the polyaddition of Di-functional DTMP-based 6-CC (Di-DTMPC) and DAP. DiDTMPC was synthesized by the procedure similar to multi-functional 6-Cs. The synthetic route to LPAHU was shown in Scheme S1.

## 4. Fabrication of networked PAHU films

Multi-functional 6-CCs and DTMPC were dissolved in DMF ( 1.0 mL ) at ambient temperature to prepare the carbonate monomer solution at different molar ratios ( $5,10,15$ or 20 mol\% multi-functional 6-CCs per total carbonate monomer (multi-functional 6-CCs + DTMPC)). To the solutions, DAP dissolved in DMF ( 1.0 mL ) was added and then the mixtures ([carbonate $]_{0}=0.5 \mathrm{M},[6-\mathrm{CC}]_{0} /\left[\mathrm{NH}_{2}\right]_{0}=1.0$ ) were stirred at ambient temperature for ca. 5 min . After that, the solutions were poured in glass petri-dishes with 6.0 cm in diameter and allowed
to stand at $60^{\circ} \mathrm{C}$ overnight in an oven under ambient atmosphere. The resulting films were carefully removed and immersed in distilled water for purification. After drying under ambient atmosphere, the networked PAHU films were obtained.

## 5. Investigation of swelling properties of networked PAHU films

PAHU films cut to dumbbell-shaped plates (length, 3.5 cm ) with a Super dumbbell cuter (DUMBBELL Co., Ltd) and immersed in $\mathrm{H}_{2} \mathrm{O}, \mathrm{MeOH}$, acetone or DMF at ambient temperature for 24 h . After that, their lengths were measured before drying and then the ratio of these lengths were defined as swelling ratios (unit, \%).

## 6. Investigation of fragmentation/extension properties of LPAHU

LPAHU 187 mg ( 0.20 unit mmol, acetal structure $=$ ca. 0.4 mmol ) and $\mathrm{TsOH} \cdot \mathrm{H}_{2} \mathrm{O} 15 \mathrm{mg}(0.08 \mathrm{mmol}$, 0.2 equiv. per acetal structure of LPAHU) were dissolved in DMF ( 1 mL ). To the solution, $\mathrm{MeOH}(4 \mathrm{~mL})$ was added and the mixture was stirred at $60^{\circ} \mathrm{C}$ for ca. 1 h . The fraction of the mixture was analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy and SEC measurements. After that, the mixture was concentrated and dried at $60^{\circ} \mathrm{C}$ under reduced pressure for ca. 1 h . The resulting sticky solids were analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy and SEC measurements.

## 7. Investigation of crosslinking/de-crosslinking functions of networked PAHU films

To a 25 mL round-bottom flask were added PAHU films hashed, $\mathrm{TsOH} \cdot \mathrm{H}_{2} \mathrm{O}$ ( 0.4 equiv. per acetal structure of the film), DMF ( 2 mL ). By heating at $60^{\circ} \mathrm{C}$ for ca .30 min , the films were dissolved in the solvents to give pale yellow solutions. The solutions were moved into glass petri-dishes in a diameter of 6.0 cm and then kept at $60^{\circ} \mathrm{C}$ overnight in an oven under ambient atmosphere. The resulting films were detached carefully from the dishes and immersed into water to remove residual DMF and TsOH. After drying under ambient atmosphere overnight, re-formed PAHU films were obtained. The de-crosslinking/re-crosslinking treatment was repeated 10 times and the re-formed film obtained in each cycle was characterized for their mechanical properties by tensile tests. In 2-10th processes, the re-formed films were readily able to be dissolved at the condition of $\mathrm{TsOH} \cdot \mathrm{H}_{2} \mathrm{O}$ ( 0.2 equiv. per acetal structure).
