Experimental extraction methodology validation of model mixture with aq. ethanol (wt. 70%)

Table S1: Experimental solute distribution coefficient (β) and selectivity (S) for the system {limonene(1) + linalool(2) + aq.ethanol (70 wt. %) (3)} at T=298.15 K and P=101.3 kPa

Terpene rich phase		Ethanolic rich phase		Selection Parameter			
w ₁	w ₂	w ₁	w ₂	δ (%)	β ₁	β ₂	S
0.932	0.022	0.038	0.021	0.050	0.040	0.950	23.310
0.928	0.027	0.040	0.022	0.110	0.040	0.820	19.120
0.923	0.032	0.041	0.024	0.110	0.040	0.770	17.130
0.893	0.061	0.040	0.026	0.090	0.050	0.430	9.410
0.863	0.068	0.055	0.039	0.120	0.060	0.570	8.960
0.810	0.090	0.051	0.043	0.140	0.060	0.480	7.670
0.742	0.121	0.057	0.066	0.140	0.080	0.540	7.050
0.701	0.138	0.061	0.075	0.080	0.090	0.550	6.260

Standard uncertainties u are u(T)=0.05 K, u(P)=0.5 kPa and u(w)=0.005.

COSMO-RS predicted extraction results of model mixture with DES

Table S2: COSMO-RS predicted solute distribution coefficient (β) and selectivity (S) for the system {limonene(1) + linalool(2) + DES 1(3)} at T=298.15 K

Terpene rich phase		DES rich phase		Selection Parameter

Characterisation of crude orange essential oil (COEO) on GC-MS

In the following figure, the characterisation of used real crude orange essential oil is shown by the GC-MS spectrum, where the peaks were identified by NIST library and retention time confirmation of limonene and linalool standards

Figure S1: The GC-MS spectrum of crude orange essential oil (COEO)
