

SUPPORTING INFORMATION

Global transcriptomic effects of environmentally relevant concentrations of the neonicotinoids clothianidin, imidacloprid, and thiamethoxam in honey bees (*Apis mellifera*)

Contents

Materials and Methods: RNA isolation, reverse transcription and qPCR, RNA-sequencing

Tables

S1 Exposure concentrations of used neonicotinoids

S2 Sequences of used qPCR primers

S3 Number of up- and down-regulated unigenes

S4 List of differentially expressed unigenes

S5-S11 Enriched GO terms among differentially expressed unigenes

S12 Transcriptional alterations of selected genes from Christen et al. (2016)

Figures

S1 Experimental design of laboratory exposure experiment

S2 Enriched GO terms between control and solvent control

S3 Enriched GO terms between control and solvent control

S4 Validation of reference genes

S5 Abundance of *achrα1*

S6 Abundance of 9 different transcripts after 24h exposure to clothianidin

Materials and methods

RNA isolation, reverse transcription, and quantitative PCR

The brains of frozen bees were removed in total by opening the cranium using a scalpel and forceps. Total RNA of three bee brains were pooled in each replicate and isolated using RNeasy mini kit from Qiagen according to the manufacturer's instructions. For each exposure concentration, five biological replicates were isolated. The quantity and the quality of the isolated RNA was analysed using Experion™ Automated Electrophoresis System (Biorad) according to the manufacturer's instructions. RNA samples were diluted to 100 ng/mL with RNase/DNase free water and stored at -80°C until further use. To validate RNA-sequencing data, 1000 ng RNA were reverse transcribed as described before.²¹ qPCR of selected target genes based on SYBR green fluorescence (SYBR green PCR master mix; Roche) was performed as previously.^{16,21} Primer sequences were taken from literature or self-designed using NCBI primer BLAST tool and Geneious v. 11.0.4⁴² (Table S2).

Illumina RNA sequencing experiment

Library preparation

The quality of the isolated RNA was determined with a Qubit® (1.0) Fluorometer (Life Technologies, California, USA) and Bioanalyzer 2100 (Agilent, Waldbronn, Germany). Only those samples with a 260 nm/280 nm ratio between 1.8–2.1 and a 28S/18S ratio within 1.5–2 were further processed. The TruSeq RNA Sample Prep Kit v2 (Illumina, Inc, California, USA) was used in the succeeding steps. Briefly, total RNA samples (100-1000 ng) were ribo-depleted using Ribo Zero Gold (Epicentre®, USA) and then fragmented. Fragmented samples were reverse transcribed to cDNA, end-repaired and polyadenylated before ligation of TruSeq adapters. Fragments containing TruSeq adapters on both ends were selectively enriched with PCR. The quality and quantity of the enriched libraries were validated using Qubit® (1.0) Fluorometer and the Caliper GX LabChip® GX (Caliper Life Sciences, Inc., USA). The libraries were normalized to 10 nM in Tris-Cl 10 mM, pH 8.5 with 0.1% Tween 20.

Cluster Generation and Sequencing

The TruSeq SR Cluster Kit HS4000 (Illumina, Inc, California, USA) was used for cluster generation using 2 nM of pooled normalized libraries on the cBOT. Sequencing was performed on the Illumina HiSeq 4000 single end 125 bp using the TruSeq SBS Kit HS4000 (Illumina, Inc, California, USA) .

Tables

Table S1: Concentration of the three neonicotinoids used in the present study.

Compound	Concentration (ng/bee)	Concentration (ng/mL sucrose solution)
Clothianidin	0.3 and 3	3 and 30
Imidacloprid	0.3 and 3	3 and 30
Thiamethoxam	0.1 and 1	1 and 10

Table S2: Sequences of qPCR primers

Table S3: Number of up- and down-regulated unigenes.

Exposures	Concentration	Up-regulated	Down-regulated	Total
Solvent control	0.1% DMSO	6	2	8
Clothianidin	0.3 ng/bee	4	14	18
	3 ng /bee	10	234	244
Imidacloprid	0.3 ng/bee	7	19	26
	3 ng/bee	36	77	113
Thiamethoxam	0.1 ng/bee	4	2	6
	1 ng/bee	4	21	25

Table S4: List of differentially expressed unigenes of *A. mellifera* treated with 0.3 ng/bee and 3 ng/bee clothianidin (CLO_0_3 and CLO_3), 0.3 ng/bee and 3 ng/bee imidacloprid (IMD_0_3 and IMD_3) and 0.1 ng/bee and 1 ng/bee thiamethoxam (TMX_0_1 and TMX_1), respectively, or the solvent control (0.1% DMSO). Unigenes that were expressed in < 50% of the replicates of each exposure are in italic and were not used for further analyses. logFC = log fold change, FDR = corrected p-value of false discovery rate, Function = annotated function, where NA = no annotation.

Figures

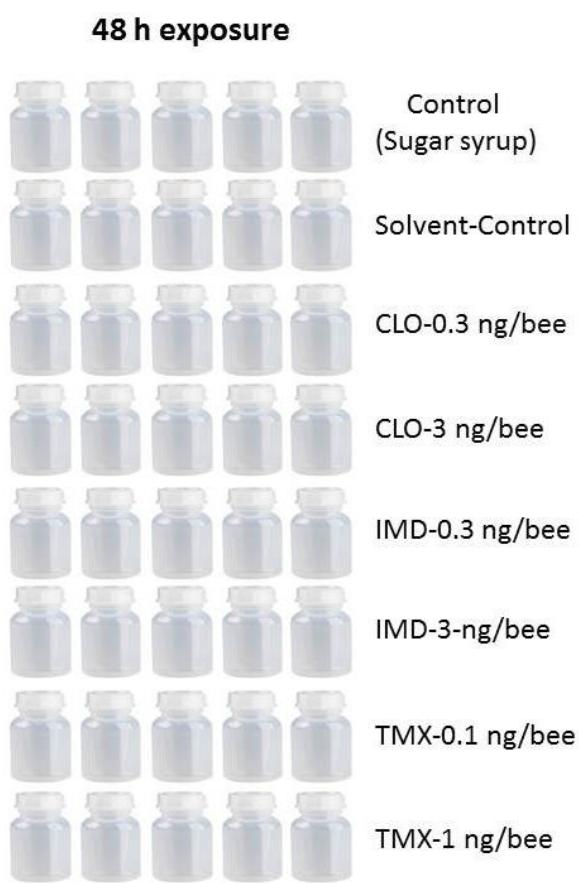

Figure S1: Experimental design of laboratory exposure experiment. Each treatment concentration consists of five bottles with ten bees each. The bees were exposed for 48 h to sucrose solution, solvent control (0.1% DMSO) or the three neonicotinoids dissolved in 0.1% DMSO. Brains of three bees per bottle were pooled to one RNA sample.

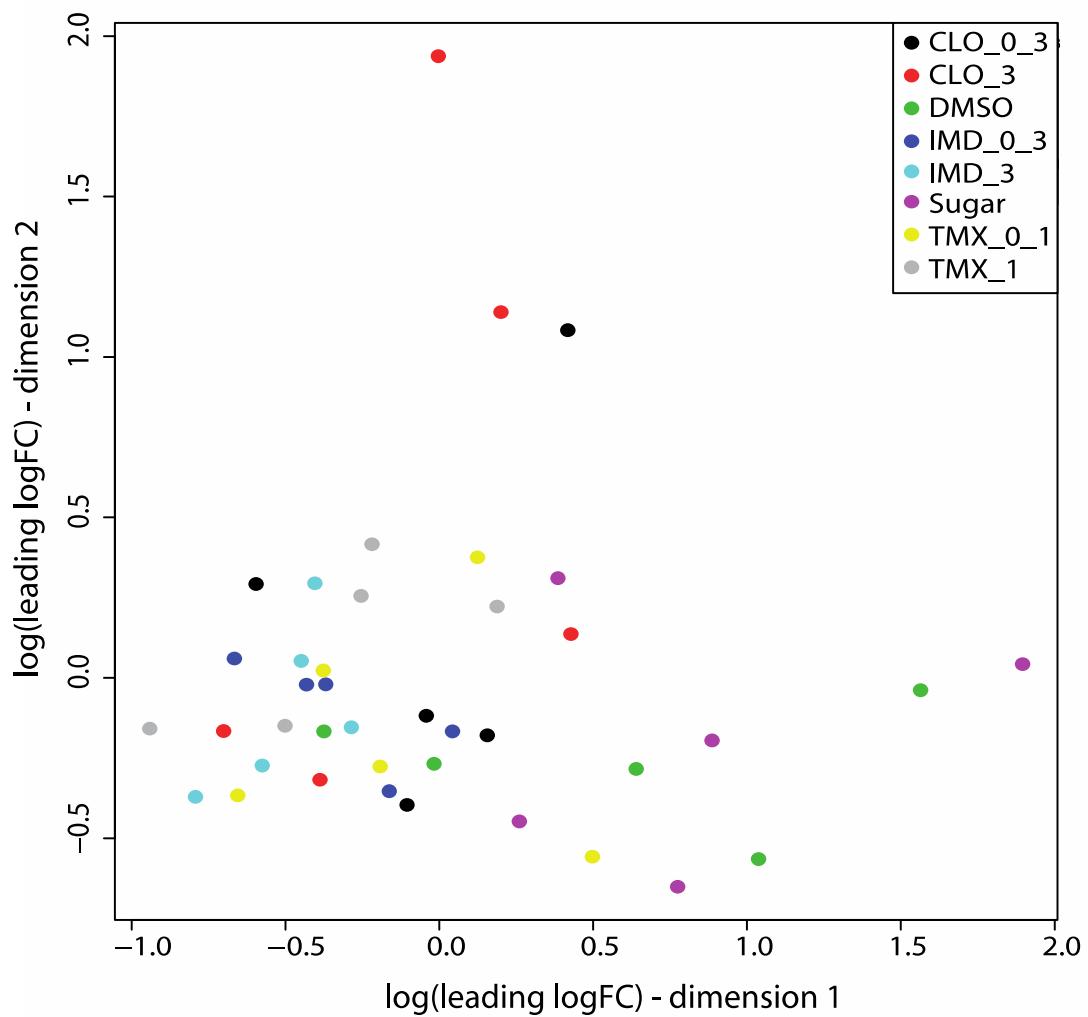

Figure S2: MDS (multidimensional scaling) plot of the normalized expression data showing relationships between the different neonicotinoid treatments, the solvent control (DMSO) and the control (sugar). Distance between samples indicates similarity.

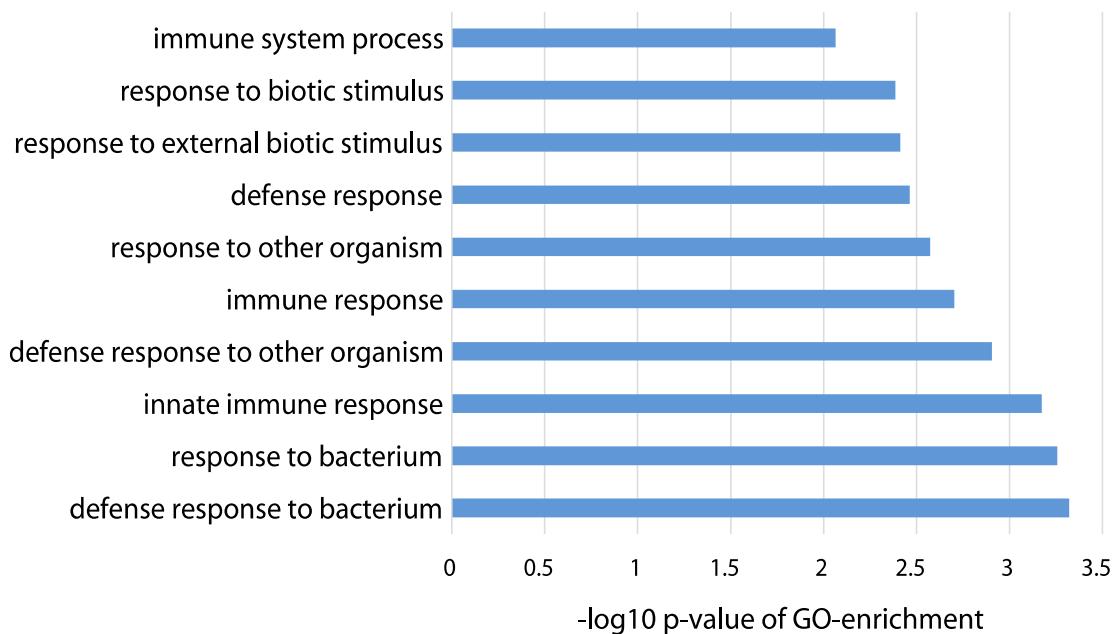

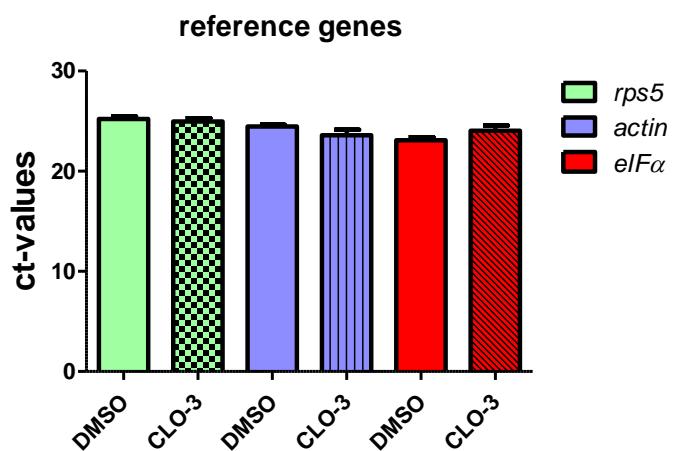

Figure S3: Enriched GO terms of biological processes that were significantly overrepresented before multiple testing (Fisher's exact test; $p < 0.01$) of differentially expressed unigenes of *A. mellifera* treated with the solvent control (0.1% DMSO in sucrose solution).

A:

B:

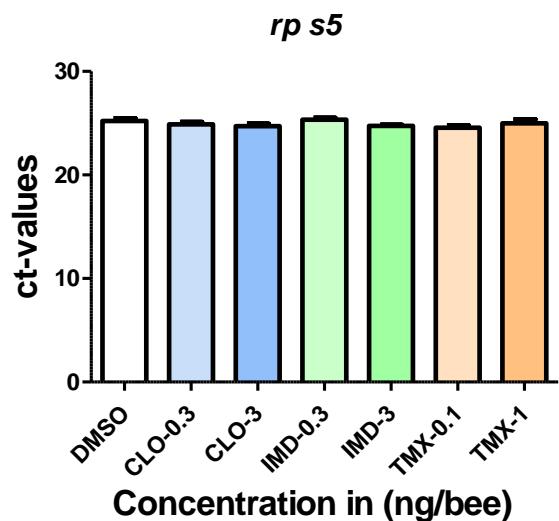

Figure S4: Validation of reference genes for quantification of gene expression in the brain of honey bees. (A) Expression of *rps5* (green), *actin* (blue) and *eIF α* (red) in the brain of bees exposed to 3 ng/bee of clothianidin or solvent control (0.1% DMSO). (B) Expression of *rps5* in the brain of bees exposed to solvent control (0.1% DMSO) (white), clothianidin (blue), imidacloprid (green) and thiamethoxam (orange). The values are given as cycle threshold values (Ct). Each bar represents the mean of three replicates with error bars indicating standard deviation.

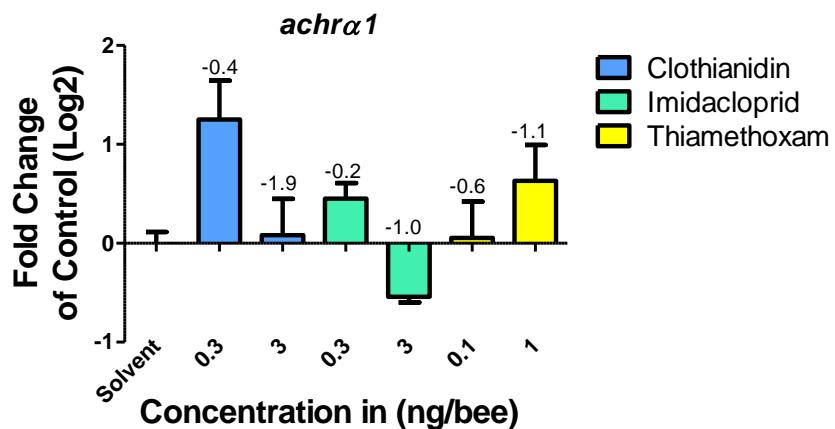

Figure S5: Abundance of transcript *achra1* in the brain of honey bees following exposure to different concentrations of clothianidin (blue bars), imidacloprid (green bars) and thiamethoxam (yellow bars) for 48 h. Values above bars represent log₂ (fold change) of RNA sequencing. Shown are the results of five biological replicates per concentration.

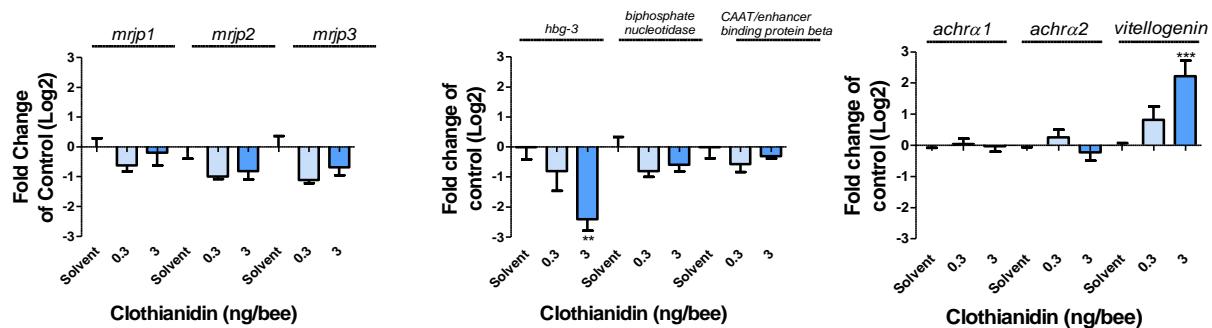

Figure S6: Abundance of transcripts *mrjp1*, *mrjp2*, *mrjp3*, *hb-3*, *biphosphate-nucleotidase*, *CAAT/enhancer binding protein beta*, *achra1*, *achra2* and *vitellogenin* in the brain of honey bees following exposure to 0.3 (light blue bars) and 3 (dark blue bars) ng/bee clothianidin for 24 h. Shown are the results of five biological replicates per concentration. Significant differences with p-value of ≤ 0.05 are marked with asterisks.
