Figure S1. IR spectra of Ca-ALG (a), CS (b), PEC bilayer films (c) and Na-ALG (d).

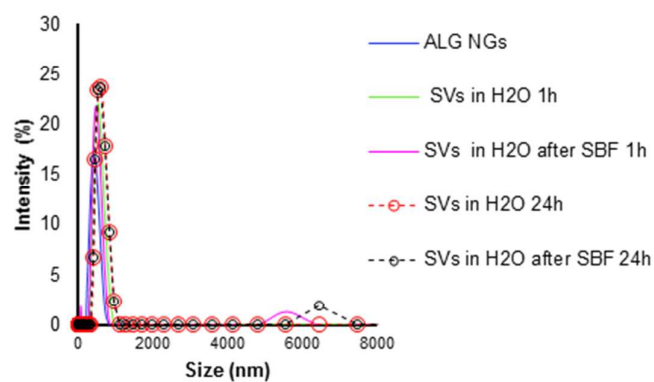

Figure S2. Intensity-weighted size distribution of ALG/CS SVs in UPW and in SBF (24 h of incubation) obtained from DLS measurements.

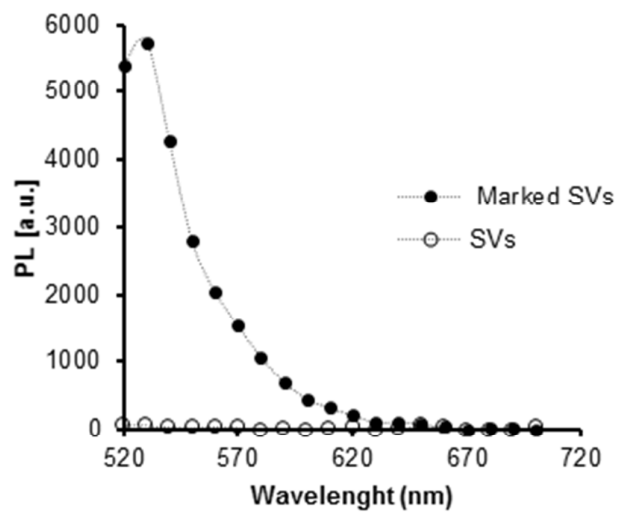

Figure S3. Photoluminescence spectra of fluorescent SVs (with labelled CS) and bare SVs. Fluorescent SVs were modified by labelling their CS external layer with the Abberion STAR 488 dye (Sigma-Aldrich). Fluorescent SVs exhibited a peak of emission at 530 nm (λ_{ex} 500 nm).
