## S-I Characterization and Measurements

General information: The ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on AVANCE 500 spectrometers at 298 K by utilizing deuterated dimethyl sulfoxide (DMSO) as solvents and tetramethylsilane (TMS) as a standard. The compounds were characterized by a Flash EA 1112, CHNS-O elemental analysis instrument. The MALDI-TOF-MS mass spectra were recorded using an AXIMA-CFR ${ }^{\mathrm{TM}}$ plus instrument.

Electrochemical characterization: Cyclic voltammetry (CV) was performed with a BAS 100W Bioanalytical Systems, using a glass carbon disk ( $\Phi=3 \mathrm{~mm}$ ) as the working electrode, a platinum wire as the auxiliary electrode with a porous ceramic wick, $\mathrm{Ag} / \mathrm{Ag}^{+}$as the reference electrode, standardized for the redox couple ferricinium/ferrocene. All solutions were purged with a nitrogen stream for 10 min before measurement. The procedure was performed at room temperature and a nitrogen atmosphere was maintained over the solution during measurements.

Thermal stability measurements: Thermal gravimetric analysis (TGA) was undertaken on a PerkinElmer thermal analysis system at a heating rate of $10{ }^{\circ} \mathrm{C} \mathrm{min}^{-1}$ and a nitrogen flow rate of $80 \mathrm{~mL} \mathrm{~min}^{-1}$.

## S-II Synthesis

All the reagents and solvents used for the synthesis were purchased from Aldrich or Acros and used as received. All reactions were performed under nitrogen atmosphere.
1-bromoacridine, 9-(4-(4, 4, 5, 5-tetramethyl-1, 3, 2-dioxaborolan-2-yl)phenyl)-9H-carbazole and $N$-phenyl-3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan -2-yl)-phenothiazine was synthetized as our previous work ${ }^{1-4}$.

## 1-(4-(9H-carbazol-9-yl)phenyl)acridine

A mixture of 9-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl)-9H-carbazole ( 2.4 mmol ), 1Br-bromoacridine ( 2.0 mmol ), sodium carbonate ( 20 mmol ), toluene $(15 \mathrm{~mL})$, absolute alcohole $(10 \mathrm{ml})$ and deionized water $(10 \mathrm{~mL})$, with $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(60$ mg ) acting as catalyst was refluxed at $90{ }^{\circ} \mathrm{C}$ for 48 h under nitrogen. After the mixture was cooled down, 40 mL water was added to the resulting solution and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ for several times. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and solvent evaporation, the liquid was purified by chromatography using the mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /petroleum ether as the eluent to afford a white solid ( 0.60 g , yield $71 \%$ ). MS (ESI): m/z $422.2\left(\mathrm{M}(\mathrm{H})^{\dagger}\right) .{ }^{1} \mathrm{H}$ NMR ( 500 MHz , DMSO) $\delta 9.16(\mathrm{~s}, 1 \mathrm{H}), 8.36-8.25(\mathrm{~m}, 4 \mathrm{H}), 8.22(\mathrm{~d}, \mathrm{~J}=8.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.99(\mathrm{t}, \mathrm{J}=7.4$ $\mathrm{Hz}, 1 \mathrm{H}), 7.97-7.86(\mathrm{~m}, 5 \mathrm{H}), 7.73(\mathrm{~d}, \mathrm{~J}=6.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.64(\mathrm{t}, \mathrm{J}=9.0 \mathrm{~Hz}, 3 \mathrm{H}), 7.52(\mathrm{t}$, $\mathrm{J}=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.36(\mathrm{t}, \mathrm{J}=7.4 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{CDCl} 3\right) \delta 140.81(\mathrm{~s})$, 139.76 (s), 138.60 (s), 137.51 (s), 131.56 (s), 130.79 (s), 129.88 (s), 129.19 (s), 128.65 (s), 127.09 ( s$), 126.57$ (d, $J=16.6 \mathrm{~Hz}$ ), 126.08 ( s$), 125.89$ ( s$), 125.37$ (s), 123.60 (s), 120.46 (s), 120.21 (s), 109.87 (s). Elemental analysis. Found: C, 88.80 ; H, 4.67; N, 6.57\%. Calc. for $\mathrm{C}_{32} \mathrm{H}_{21} \mathrm{~N}$ : C, 88.54; H, 4.79; N, 6.66\%.

## 4-(acridin-1-yl)-N,N-diphenylaniline

A mixture of $\mathrm{N}, \mathrm{N}$-diphenyl-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)aniline ( 2.6 mmol ), 1Br-bromoacridine ( 2.0 mmol ), sodium carbonate ( 20 mmol ), toluene $(15 \mathrm{~mL})$, absolute alcohole ( 10 ml ) and deionized water $(10 \mathrm{~mL})$, with $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(60$ mg ) acting as catalyst was refluxed at $90{ }^{\circ} \mathrm{C}$ for 48 h under nitrogen. After the mixture was cooled down, 40 mL water was added to the resulting solution and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ for several times. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and solvent evaporation, the liquid was purified by chromatography using the mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /petroleum ether as the eluent to afford a green solid ( 0.55 g , yield $65 \%$ ). MS (ESI): m/z 423.4(M(H) ${ }^{+}$). ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , DMSO): $\delta 9.04(\mathrm{~s}, 1 \mathrm{H}), 8.26-8.13(\mathrm{~m}, 3 \mathrm{H}), 7.99-7.82(\mathrm{~m}, 2 \mathrm{H}), 7.67-7.58$ $(\mathrm{m}, 1 \mathrm{H}), 7.55(\mathrm{dd}, \mathrm{J}=11.6,7.7 \mathrm{~Hz}, 3 \mathrm{H}), 7.40(\mathrm{t}, \mathrm{J}=7.8 \mathrm{~Hz}, 4 \mathrm{H}), 7.24-7.08(\mathrm{~m}$, $8 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 147.65,130.87,129.44,128.67,126.48,126.11$, $125.69,125.51,124.86,123.35,122.96$. Elemental analysis. Found: C, 88.12; H, 5.25; $\mathrm{N}, 6.63 \%$. Calc. for $\mathrm{C}_{32} \mathrm{H}_{23} \mathrm{~N}: \mathrm{C}, 88.62 ; \mathrm{H}, 5.19 ; \mathrm{N}, 6.60 \%$.

## 3-(acridin-1-yl)-10-phenyl-10H-phenothiazine

A mixture of 10-phenyl-3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-10Hphenothiazine ( 2.6 mmol ), 1Br-bromoacridine ( 2.0 mmol ), sodium carbonate ( 20 $\mathrm{mmol})$, toluene $(15 \mathrm{~mL})$, absolute alcohole ( 10 ml ) and deionized water ( 10 mL ), with $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(60 \mathrm{mg})$ acting as catalyst was refluxed at $90{ }^{\circ} \mathrm{C}$ for 48 h under nitrogen. After the mixture was cooled down, 40 mL water was added to the resulting solution and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ for several times. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and solvent evaporation, the liquid was purified by chromatography using the mixture of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /petroleum ether as the eluent to afford a green solid ( 0.59 g , yield $65 \%$ ).MS (ESI): m/z $454.2\left(\mathrm{M}(\mathrm{H})^{+}\right) .{ }^{1} \mathrm{H}$ NMR ( 500 MHz , DMSO) $\delta 8.96(\mathrm{~s}, 1 \mathrm{H}), 8.21(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.16(\mathrm{dd}, J=8.7,3.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.87$ (dt, $J=9.0,6.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.75$ (t, $J=7.8 \mathrm{~Hz}, 2 \mathrm{H}$ ), $7.66-7.53$ (m, 4H), $7.50(\mathrm{~d}, J=6.8$ $\mathrm{Hz}, 1 \mathrm{H}), 7.33(\mathrm{~d}, J=1.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.19(\mathrm{dd}, J=8.4,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.14(\mathrm{~d}, J=7.5 \mathrm{~Hz}$, $1 \mathrm{H}), 6.99(\mathrm{t}, J=7.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.91(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.35(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.21$ (d, $J=8.2 \mathrm{~Hz}, 1 \mathrm{H}){ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 144.07$ ( s$), 140.78$ (s), $139.52(\mathrm{~s})$, 131.02 (d, $J=13.3 \mathrm{~Hz}$ ), $128.80-128.42(\mathrm{~m}), 128.04$ (s), 127.08 (s), 126.84 (s), 126.49 (s), 125.73 (d, $J=11.5 \mathrm{~Hz}$ ), 125.44 (s), 122.74 ( s$), 119.62$ (s), 116.08 (s), 115.77 (s).Elemental analysis. Found: C, 82.80; H, 4.40; N, 6.13; S, 7.30\%. Calc. for $\mathrm{C}_{31} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{~S}: \mathrm{C}, 82.27$; H, 4.45; N, 6.19; S, 7.08\%.

## Details of the Lippert-Mataga solvatochromic model

First, the larger slope in the Lippert-Mataga solvatochromic model could indicate the generation of CT or CT-like (such as HLCT) excitons. According to the definition of dipole moment ( $\mu$ ) of an exciton:

$$
\mu=q \cdot d
$$

where $q$ is the partial charge of hole and electron moieties, and $d$ is the distance between the electronic centers of them. Generally, CT excitons are always of relatively larger dipole moments than the LE excitons due to that the q and d of CT excitons are obviously larger than the charge-unseparated LE excitons, especially for the two excited state components (LE and CT) in one compound. Therefore, the energy of CT excitons will be stabilized in the solvents with larger polarity, and results in larger stokes shift than the LE excitons and larger slope in the Lippert-Mataga solvatochromic model. Usually, the dipole moment of LE exciton is near or smaller than 10 Debye, while that of the HLCT or CT excitons is always larger, especially for the pure CT excitons, it could be $>20$ Debye.

Next, the shape of the Lippert-Mataga solvatochromic model can be the criteria for judging the hybridization status of different materials, instead of simply judging from the scale of the dipole moments. As we have mentioned in the maintext, in Figure 5b, the three materials demonstrate three typical hybridization statues. In CZP-1AC, a two-section line can be fitted, corresponding to two excited dipole moments of 7.5 Debye (in small polarity circumstance) and 16.7 Debye (in large polarity circumstance). Similarly, in PTZ-1AC, a three-section line corresponding to the dipole moments of 13.2 Debye, 13.9 Debye and 31.2 Debye can be fitted. In these two situations, the excited state components could be distinguished, which could be assigned to smaller coupling (J) between LE and CT components as we mentioned in the part of theoretical calculations, representing the LE-dominated state and the

CT-dominated state. However, TPA-1AC only demonstrate one straight line with a dipole moment of 14.8 Debye, meaning that its state coupling is relatively larger, corresponding to a well-hybridized state.

Table S3 The thermal properties and electrochemical of CZP-1AC, TPA-1AC and PTZ-1AC

|  | CZP-1AC | TPA-1AC | PTZ-1AC |
| :---: | :---: | :---: | :---: |
| $\mathrm{T}_{\mathrm{d}}{ }^{\mathrm{a}}\left({ }^{\circ} \mathrm{C}\right)$ | 384 | 360 | 384 |
| $\mathrm{HOMO}^{\mathrm{b}}(\mathrm{eV})$ | -5.60 | -5.24 | -5.01 |
| LUMO $^{\mathrm{b}}(\mathrm{eV})$ | -2.89 | -2.85 | -2.86 |
| $\mathrm{E}_{\mathrm{g}}{ }^{\mathrm{c}}$ | 2.71 | 2.39 | 2.15 |

${ }^{a} \mathrm{~T}_{\mathrm{d}}$ is thermal-decomposition temperature at a weight percentage of $95 \%$. ${ }^{\mathrm{b}}$ HOMO and LUMO levels were measured based on ferrocene as reference $(\mathrm{Fc})(4.8 \mathrm{eV}) .{ }^{\mathrm{c}} \mathrm{E}_{\mathrm{g}}$ $(\mathrm{eV})=$ LUMO $(\mathrm{eV})$ - HOMO $(\mathrm{eV})$.

Figure S2 NTO of the $S_{0} \rightarrow S_{1}$ and $S_{0} \rightarrow S_{2}$ transition for AC at $S_{1}$-geometry.

CZP-1AC

TPA-1AC

PTZ-1AC

Figure S3 Atom lables for three compounds. We order the atoms from acrinde (1-14) to donor. Since hydrogen atoms usually have little contribution to the transitions we are interested in, they are labled at the latest and usually ignored by default in TDM calculations. The colored maps illustrate the matrix elements of the transitions from atoms on abscissa to atoms on ordinate for the three structures. Since we arrange their atoms sequentially along the positive direction of each axes, the left-lower region denotes the LE transition of acridine, the right-lower region denotes the CT transition from donor to acridine and the right-high region denotes the LE transition of donor. In this way, the LE:CT proportion of each structures could be directly calculated according to the calculus of matrix elements.

|  | CZP-1AC | TPA-1AC | PTZ-1AC |
| :--- | :--- | :--- | :--- |
| LE (AC) | 0.48871 | 0.36623 | 0.15841 |
| CT (from donor AC) | 0.12086 | 0.22410 | 0.36211 |
