General Information

All reactions were performed under Ar atmospheres in glassware with magnetic stirring. Unless otherwise stated, all reagents were purchased from commercial suppliers and used without further purification. All solvents were purified and dried according to standard methods prior to use. Organic solutions were concentrated under reduced pressure on a rotary evaporator or an oil pump. Reactions were monitored through thin layer chromatography (TLC) on silica gel-precoated glass plates. Chromatograms were visualized by fluorescence quenching with UV light at 254 nm. Flash column chromatography was performed using Qingdao Haiyang flash silica gel (200-300 mesh). ¹H and ¹³C NMR spectra were recorded in CDCl₃ using a 300MHz NMR instrument (referenced internally to Me₄Si). Chemical shifts (δ , ppm) are relative to tetramethylsilane (TMS) with the resonance of the non-deuterated solvent or TMS as the internal standard. ¹H NMR data are reported as follows: chemical shift, multiplicity (s = singlet; d = doublet; q = quartet; m = multiplet; br =broad), coupling constant (Hz), and integral. Data for ¹³C NMR spectra are reported in terms of chemical shift. Optical rotation was obtained on an Autopol V Plus polarimeter. Accurate mass measurements were performed using an Agilent instrument with the ESI-MS technique. HPLC analysis was performed on Agilent 1100 series and Agilent 1260 series, UV detection monitored at 254 nm, using a IA, OOG-4457-EO, R&C, IBN5 column with hexane and *i*-PrOH as solvents. X-ray crystallographic data were collected using a Gemini E Rigak.

Preparation of Starting Materials

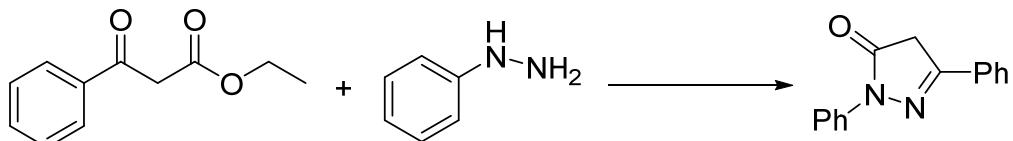

Representative Procedure for the Preparation of Ethynyl Benzoxazinanones¹

Trimethylsilylacetylene (24 mmol, 3.4 mL) was dissolved into 50 mL THF and cooled to 0°C , then $n\text{-BuLi}$ (22 mmol) was added via syringe. After stirred at this temperature for 15 min under argon atmosphere, N-(2-formylphenyl)-4-methylbenzenesulfonamide (10 mmol, 2.75 g) was added. After the starting material was consumed, the mixture was then cooled to -78°C . And Et_3N (40 mmol, 5.58 mL) was added followed by a THF solution of triphosgene (10 mmol, 2.96 g in 20 mL THF). After the mixture was stirring at -78°C for 30 min, water (100 mL) was added to quench the reaction. After extracted with DCM and dried with Na_2SO_4 , the solvent was removed under vacuum. The crude product was used directly without further purification.

Then product of last step was redissolved in THF (50 mL). After the mixture was cooled to -78°C , TBAF (10 mmol, 1.0 N in THF) was added dropwise. The mixture was allowed to stirring at this temperature for further 10 min before quenched with aq. NH_4Cl . The mixture was extracted with DCM and purified by column chromatography (PE/EtOAc = 7:1) to give the product as white solid (2.59 g, 79% yield over two steps).

Representative Procedure for the Preparation of Pyrazolone²

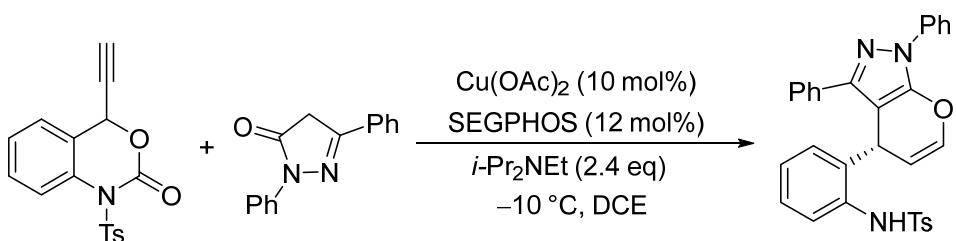

To 1 eq. (0.035 mol) of β -ketoester in 50 ml of acetic acid was added 1 eq. of substituted phenylhydrazine (for HCl salt 1 eq. of triethylamine was added). The content was refluxed for 24–36 h, the contents cooled, and solvent was removed in vacuo. To the precipitate in flask was added ethylacetate to suspend the product and was then filtered to obtain pure compound. Thus obtained product was dried to yield substituted pyrazolone.

General Procedure for the [3+3] Annulation

$\text{Cu}(\text{OAc})_2$ (0.01 mmol, 1.8 mg) and (*S*)-SEGPhos (0.012 mmol, 14.1 mg) were mixed in 2.0 mL DCE and stirred at -10°C for 15 min under argon atmosphere. Then *i*-Pr₂NEt (0.24 mmol, 36 μL) and Ethynyl Benzoxazinanones (0.12 mmol) were added and stirred for 15 min. Then pyrazolone (0.1 mmol) was added. The reacction mixture was stirred at -10°C until the pyrazolone fully disappeared (determined by TLC). The mixture was purified by flash column chromatography.

Scaled-up Synthesis and Synthetic Transformation

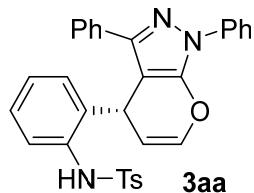

$\text{Cu}(\text{OAc})_2$ (0.25 mmol, 45 mg) and (*S*)-SEGPhos (0.3 mmol, 352.5 mg) were mixed in 50 mL of DCE and the resulting mixture was stirred at -10°C for 30 min under argon atmosphere. Then *i*-Pr₂NEt (6 mmol, 0.9 mL) and ethynyl benzoxazinanones (3 mmol, 0.98 g) were added and stirred for 30 min. Then pyrazolone (2.5 mmol, 0.59 g) was added. The reaction mixture was stirred at -10°C until the pyrazolone was fully consumed (determined by TLC). The mixture was purified by flash column chromatography to give the corresponding product.

The CCl_4 solution (1 mL) of Br_2 (5 eq) was slowly added to the solution (1 mL) of **3aa** (0.1 mmol). The reaction mixture was stirred at rt until the compound **3aa** was fully consumed (determined by TLC). Then, NaHSO_3 (sat. aq.) was added to quench the reaction. The mixture was extracted with DCM and the organic phase was dried with Na_2SO_4 . After removal of the solvent, the residue was purified by flash column chromatography to give the derivative.
