Calculations Data of 1-1 and 1-2

1. ECD calculation

The theoretical calculations of compound **1** were performed using Gaussian 09.¹ Conformational analysis was carried out. The optimized conformation geometries and thermodynamic parameters of all conformations were provided. The conformers were optimized at B3LYP/6-31G(d,p) level. The theoretical calculation of ECD was performed using time dependent Density Functional Theory (TDDFT) at B3LYP/6-31G(d,p) level in MeOH with PCM model. The ECD spectra of compound **1** were obtained by weighing the Boltzmann distribution rate of each geometric conformation.

The ECD spectra were simulated by overlapping Gaussian functions for each transition according to:

$$\Delta\epsilon(E) = \frac{1}{2.297 \times 10^{-39}} \times \frac{1}{\sqrt{2\pi}\sigma} \sum_i^A \Delta E_i R_i e^{-[(E-E_i)/(2\sigma)]^2} \quad (1)$$

The σ represented the width of the band at $1/e$ height, and ΔE_i and R_i were the excitation energies and rotational strengths for transition i , respectively. R_{vel} had been used in this work.

2. NMR calculation

For the calculations of ¹³C NMR chemical shifts, B3LYP/6-31G(d,p) method was used to optimize the selected conformations. For all optimized structures, vibrational spectra were calculated to ensure that no imaginary frequencies for energy minimum were obtained. NMR calculations were performed at the levels of mPW1PW91/6-31G(d,p) with the gauge-independent atomic orbital (GIAO) method.² The solvent effect was considered by using pyridine in the calculations to resemble the experimental condition. The polarized continuum model (PCM) of Tomasi et al. was used.³ The calculated ¹³C NMR chemical shifts were analyzed by subtracting the isotopic shifts for TMS calculated with the same methods.² Different conformers for structure **1** were considered. The ¹³C NMR chemical shifts in each compound were considered as the average values of the same atoms in the different conformers. The average values were obtained by the Boltzmann distributions, using the relative Gibbs free energies as weighting factors.⁴ The

differences $\Delta\delta$ were determined by subtracting the experimental chemical shifts δ_{exptl} from the calculated chemical shifts δ_{calcd} .
