## Materials and Methods

All purchased reagents were used as received from the vendor without modification. Infrared spectra of KBr pellets were taken using a Bruker VERTEX-70 FT-IR spectrophotometer with an operating range of $400-4000 \mathrm{~cm}^{-1}$. Elemental analyses were carried out on a via Vario EL III Etro Elemental Analyzer. Powder X-ray diffraction (PXRD) data were taken with a Bruker D8 Advance diffractometer using $\mathrm{CuK} \alpha$ radiation with $2 \theta$ angles ranging from 5 to $50^{\circ}$. Thermogravimetric analyses (TGA) were carried out within a heating range of 30 to $1000{ }^{\circ} \mathrm{C}$ with a NETZSCH STA449F5 instrument under flowing $\mathrm{N}_{2}$ while increasing temperature by $20^{\circ} \mathrm{C} / \mathrm{min}$. A Quantum Design MPMS-XL SQUID magnetometer was used for the magnetic measurements.

## Crystallographical Section

Single crystal X-ray diffraction data were collected on a Bruker Apex-II using a CCD area-detector and $\mathrm{MoK} \alpha$ radiation ( $\lambda=0.71073 \AA$ ) at 296(2) K for compounds $\mathbf{1}$ and $\mathbf{3}$ and an Agilent SuperNova diffractometer using $\mathrm{CuK} \alpha$ radiation $(\lambda=1.54184 \AA$ ) at 293(2) K for compound 2 . The reductions of data and corrections to absorption values were done via empirical methods. SHELXS- $97^{1}$ was used to solve the structure with direct methods, and this data was further refined with the full matrix least-squares method in SHELXL-97. ${ }^{2}$ All atoms were refined anisotropically other than hydrogen
atoms whose positions on the ligands were calculate and subsequently refined with a riding model while the hydrogen atoms of the hydroxyl groups and some water molecules were found by difference Fourier maps. The crystal parameters, data collection, and details of refinement for compounds 1-3 are listed in Table S1. Various bond angles and lengths of compounds $\mathbf{1}-\mathbf{3}$ are summarized in Table S3.
