## 1. General Information

Unless otherwise specified, all reagents and solvents were obtained from commercial suppliers and used without further purification. All reagents were weighed and handled in air at room temperature. Chromatographic purifications were carried out on a Biotage Isolera Four instrument.  $^1\text{H}$  NMR spectra were recorded at 400 MHz and  $^{13}\text{C}$  NMR spectra were recorded at 100 MHz by using a Bruker Avance 400 spectrometer. Chemical shifts were reported in parts per million ( $\delta$ ) relative to tetramethylsilane (TMS). The following abbreviations were used to describe peak splitting patterns when appropriate: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, brs = broad singlet. HRMS spectra spectra were performed on a spectrometer operating on EI.

### Ultrasound set-up

Ultrasound for sonochemical synthesis is generated with the help of ultrasonic instrument set-up (horn type). The specification and details of the set-up, processing parameters used during the experiments are:

Make: Yinyu Gaoke, China.

Operating frequency: 28-68 kHz.

Rated output power: 25-50 W.

Diameter of stainless steel tip of horn:  $1.3 \times 10^{-2}$  m.

Surface area of ultrasound irradiating face:  $1.32 \times 10^{-4}$  m $^2$ .

## **2. Experiment Section**

General Procedure for the Synthesis of Z-vinyl thiocyanates **2**: In a vial was placed alkyne (0.2 mmol), KSCN (39 mg, 0.4 mmol), I<sub>2</sub> (25 mg, 0.1 mmol), (NH<sub>4</sub>)<sub>2</sub>S<sub>2</sub>O<sub>8</sub> (45 mg, 0.2 mmol), HOAc (0.4 mmol), then the contents were reacted under ultrasound irradiation. The progress of the reaction was monitored by TLC. The reaction typically took 5 min. Upon completion, the reaction mixture was purified by column chromatography on silica gel (eluent: hexanes/ethyl acetate) to afford **2**.
