I. General information

Unless otherwise noted all the reactions are performed in nitrogen filled MBRAUN glove box or using standard Schlenk technique. All chemicals are purchased either from Sigma Aldrich, Alfa Aesar and Avra-chemicals and used without further purification unless mentioned. Pinacol borane (HBpin) was purchased from Sigma Aldrich. HBpin for bulk reactions was prepared from Bispinacolatodiborane ($B_2\text{pin}_2$) according to literature procedures.¹ $B_2\text{pin}_2$ was obtained from AllyChem Co. Ltd., China, and was used after further purification by sublimation process. Reagent grade solvents are purchased from SD Fine Chemicals (India), distilled and deoxygenated by freeze pump thaw cycle (three to four times) before using. CDCl_3 and $C_6\text{D}_6$ were purchased from either Cambridge Isotope Laboratories or Sigma Aldrich and deoxygenated by freeze pump thaw cycle and stored over molecular sieves before use. IMes (1,3-bis-(2,4,6-trimethylphenyl)2midazole-2-ylidene)^{2a} and $\text{Co}(\text{IMes})_2\text{Cl}$ ^{2b} were prepared according to literature procedures.

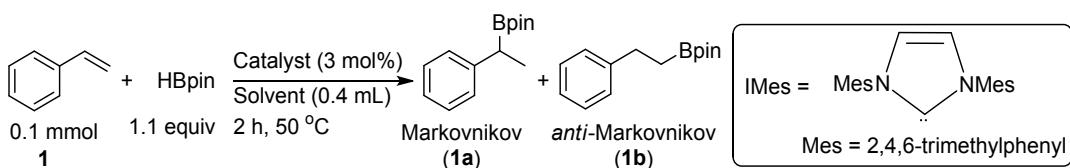

All NMR spectra (^1H (400 MHz), $^{13}\text{C}\{\text{H}\}$ (100 MHz), ^{11}B (128 MHz), ^{19}F (376 MHz)) were recorded by a Bruker Avance 400MHz NMR spectrometer at an ambient temperature. ^1H NMR chemical shifts are reported relative to TMS and were referenced *via* residual proton resonances of the corresponding deuterated solvent (CDCl_3 : 7.26 ppm, $C_6\text{D}_6$: 7.16 ppm, $C_4\text{D}_8\text{O}$: 3.58 ppm), whereas ^{13}C NMR spectra are reported relative to TMS using the carbon signals of the deuterated solvent (CDCl_3 : 77.16 ppm). ^{11}B NMR signals are quoted relative to $\text{BF}_3\cdot\text{Et}_2\text{O}$ and ^{19}F NMR signals are quoted using FCCl_3 as internal standard. ^1H NMR yield was calculated as CH_3NO_2 (nitromethane) as an internal standard. GC-MS data were acquired using GCMS-QP2010 SE SHIMADZU system. For Electrospray ionization (ESI) mass spectral analysis, Agilent 6538 Ultra high definition (UHD) accurate Mass-Q-TOF (LC-HRMS) and Bruker Daltonics make Esquire 300 Plus ESI model mass spectrometers were used. Commercially available, pre-coated TLC-sheets ALUGRAM[®] Xtra Sil G/UV₂₅₄ was purchased from MACHEREY-NAGEL GmbH & Co. KG. The removal of solvent was performed on a rotary evaporator *in vacuo* at a maximum temperature of 55 °C.

II Optimization of the Reaction Conditions

Experimental procedure described in Table 1.

In a glass vial equipped with magnetic stirring bar, Co(IMes)₂Cl (3 mol %, 0.003 mmol), HBpin (1.1 equiv, 0.11 mmol), styrene (1 equiv, 0.1 mmol) were added followed by 0.4 mL of solvent. The reaction mixture was stirred at 50 °C for the indicated amount of time, then eluted with Et₂O:hexane (3:7) mixture through a plug of celite (Ø 3 mm × 8 mm). The solvent was removed in vacuum, further dried and nitromethane was added as an internal standard. The product yield was determined from ¹H NMR using nitromethane as an internal standard.

III. Substrate Scope

General procedure A, for small scale reaction to get NMR yield:

In a glass vial equipped with magnetic stirring bar, alkene (0.1 mmol), HBpin (1.1 equiv, 0.11 mmol), Co(IMes)₂Cl (3 mol%, 0.003 mmol), were added followed by 0.4 mL of solvent. The reaction mixture was stirred at 50 °C for the indicated amount of time, then eluted with Et₂O:hexane (3:7) mixture through a plug of celite (Ø 3 mm × 8 mm). The solvent was removed in vacuo, and nitromethane was added as an internal standard. The product yield was determined from ¹H NMR using nitromethane as an internal standard.

General procedure B, for larger scale catalytic reactions:

In a glass vial equipped with magnetic stirring bar, alkene (1.0 mmol), HBpin (1.1 equiv, 1.1 mmol), Co(IMes)₂Cl (3 mol%, 0.03 mmol), were added followed by 1.2 mL of THF. The reaction mixture was stirred at 50°C for the indicated amount of time. After completion, the reaction mixture was eluted with Et₂O:hexane (3:7) mixture through a short plug of celite; the filtrate was analyzed by GC-MS. The product was purified by silica gel column chromatography eluted with mostly EtOAc:hexane (02:98) mixture.

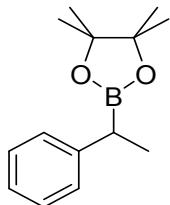

General Procedure C, for NMR scale catalytic reaction of aldehyde and ketone:

In a glass vial equipped with magnetic stirring bar, aldehyde or ketone (0.5 mmol), HBpin (1.1 equiv, 0.55 mmol), Co(IMes)₂Cl (1 mol%, 0.005 mmol), were added followed by 0.8 mL of THF. The reaction mixture was stirred at room temperature for 2 h. The solvent was removed in vacuo, and nitromethane was added as an internal standard. The product yield was determined from ¹H NMR using nitromethane as an internal standard.

Spectral Data

Co(I)-catalyzed Markovnikov selective hydroboration of alkenes:

2-(1-Phenylethyl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (1a).

The product was obtained following general procedure B as colourless oil in 86% yield (199 mg) from **1** (104 mg, 1.0 mmol).

The spectroscopic data is consistent with literature data.³

4-(1-(4,4,5,5-Tetramethyl-1,3,2-dioxaborolan-2-yl)ethyl)benzenamine (5a).

In a glass vial equipped with magnetic stirring bar, 4-vinylaniline (1.0 mmol), HBpin (2.2 equiv, 2.2 mmol), Co(IMes)₂Cl (3 mol%, 0.3 mmol), were added followed by 1.2 mL of THF. The reaction mixture was stirred at 50 °C for 24 h. Without exposing the reaction mixture to air, the solvent was evaporated under vacuum to remove unreacted HBpin. The crude mixture was then extracted with hexane, passed through cotton (product was unstable in silica or celite) and solvent was removed under vacuum. Product was obtained as a colourless oil in 74% (183 mg) yield.

The spectroscopic data is consistent with literature data.³

IV. Preliminary Mechanistic Investigations

To get insight into operative mechanistic cycle, several stoichiometric reactions were performed:

Experiment S1:

Step 1	$\text{Co}(\text{IMes})_2\text{Cl} + \text{HBpin}$ (0.05 mmol each)	$\xrightarrow[\text{THF}]{\text{rt 8h}}$	^{11}B NMR $\delta = 3.9$ ppm
Step 2	HBpin (0.05 mmol)	$\xrightarrow[\text{THF}]{50^\circ\text{C, 8h}}$	^{11}B NMR $\delta = 3.9$ ppm & 28.6 ppm
Step 3	Addition of styrene (0.05 mmol)	$\xrightarrow[\text{THF}]{\text{rt 10min}}$	^{11}B NMR $\delta = 3.9$ ppm & 33.7 ppm

Equimolar amount (0.05 mmol) of $\text{Co}(\text{IMes})_2\text{Cl}$ (35.2 mg) and HBpin (7.1 μl) were mixed in THF (0.6 ml). The reaction mixture was stirred at room temperature for 8 h. Addition of another equivalent of HBpin in the step 2 could not produce any change in the ^{11}B NMR. However, addition of styrene (0.05 mmol, 5.7 μl) in step 3 immediately resulted in the product. The mixture was further monitored by ^{11}B NMR at 10 min interval.

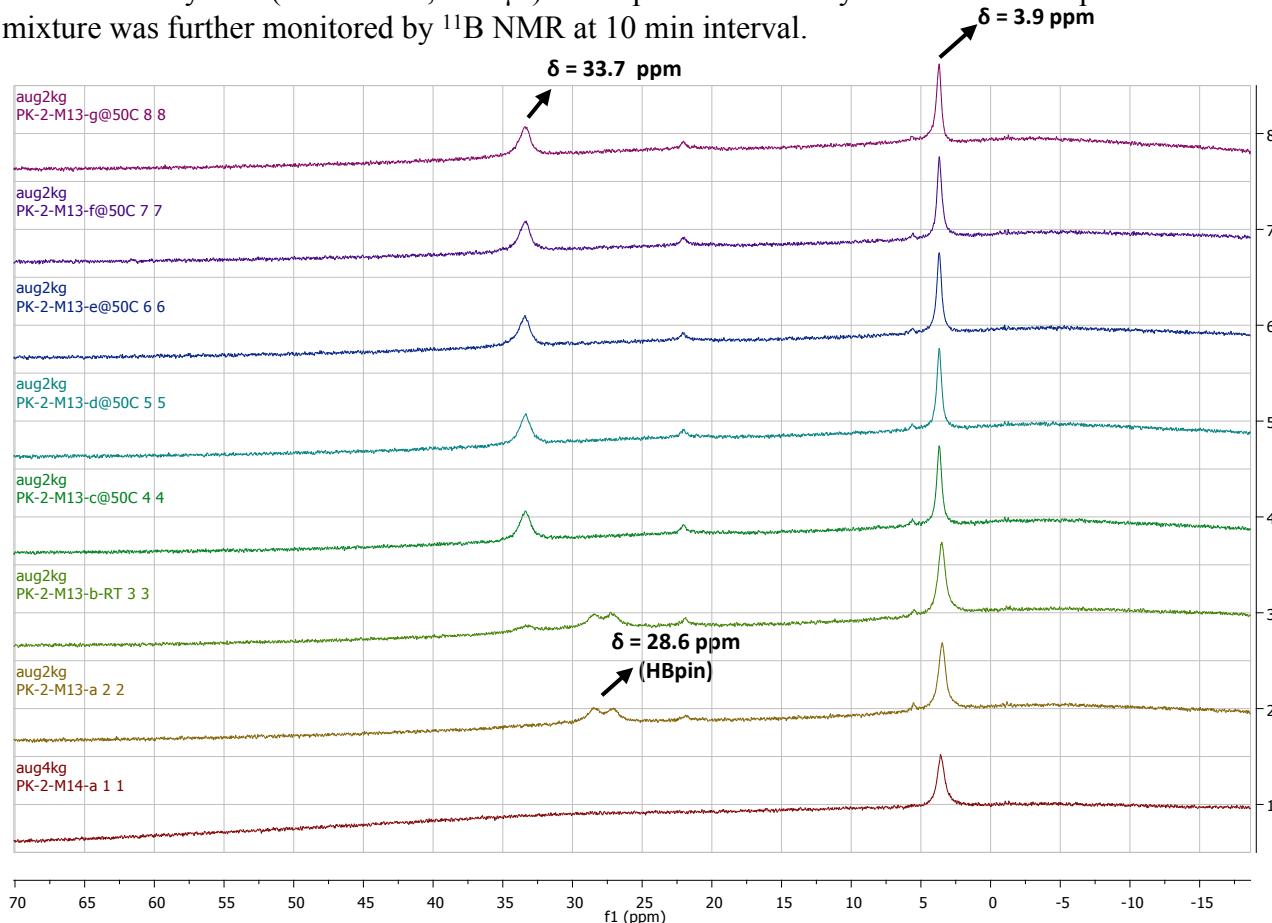

Figure S1. ^{11}B NMR spectra of (1) Equimolar amount (0.05 mmol) of $\text{Co}(\text{IMes})_2\text{Cl}$ and HBpin in THF for 8 h at rt, (2) 0.05 mmol of HBpin in (1) after 8 h, (3) 0.05 mmol of styrene at $T = 0$ min, (4) after $T = 10$ min, (5) after $T = 20$ min, (6) after $T = 30$ min, (7) after $T = 40$ min, (8) after $T = 50$ min.

The spectra show that reaction between $\text{Co}(\text{IMes})_2\text{Cl}$ and HBpin produced a boron containing entity, which is unaffected throughout the reaction. Removal of THF and recrystallization in benzene afforded a colourless crystal of compound **I**. It was further verified by HRMS of the reaction mixture of $\text{Co}(\text{IMes})_2\text{Cl}$ and HBpin in THF.

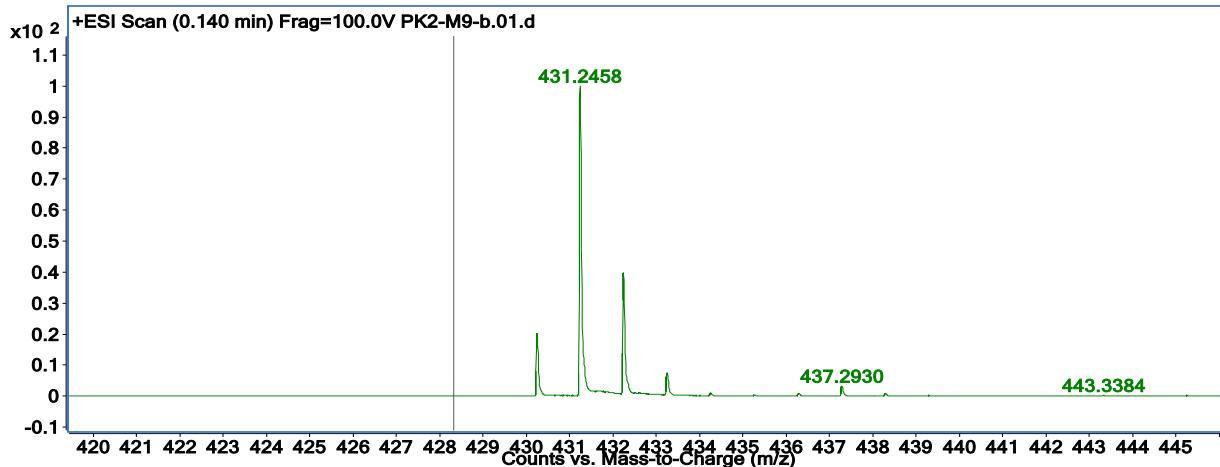

Figure S2. Mass Spectrum of complex **I** (IMes.Bpin) in THF, showing the ion peak at 431.2458 (m/z) which corresponds to $[\text{M}+\text{H}]^+$ of compound **I**. Calculated mass of the complex **I** (IMes.Bpin) is 431.2869 u.

Experiment S2:

The comparison of ^1H NMR of the catalyst, $\text{Co}(\text{IMes})_2\text{Cl}$ and mixture of $\text{Co}(\text{IMes})_2\text{Cl}$ and HBpin in d_8 -THF shows the disappearance of characteristic peaks corresponding to $\text{Co}(\text{IMes})_2\text{Cl}^{14}$, which also supports the formation of compound **I** and active catalyst.

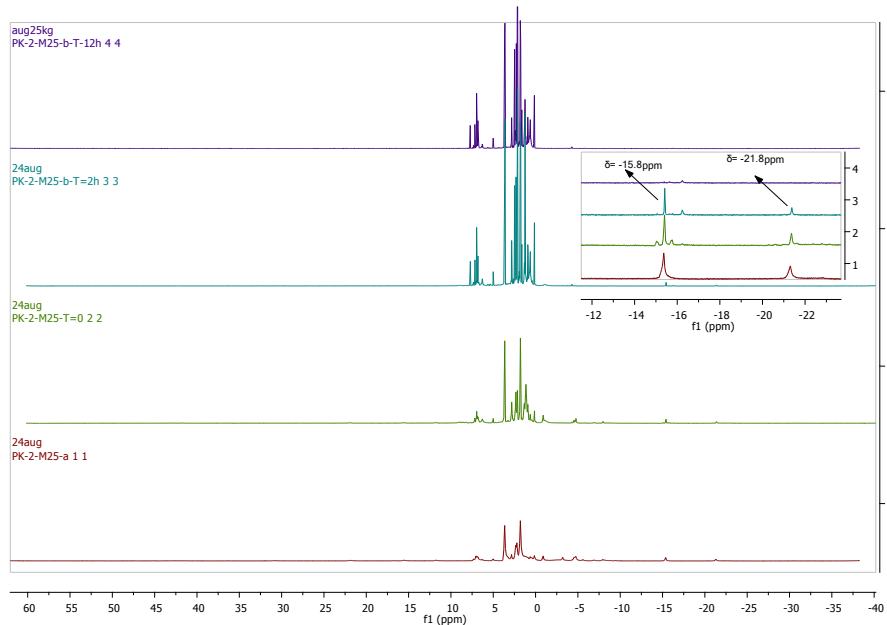

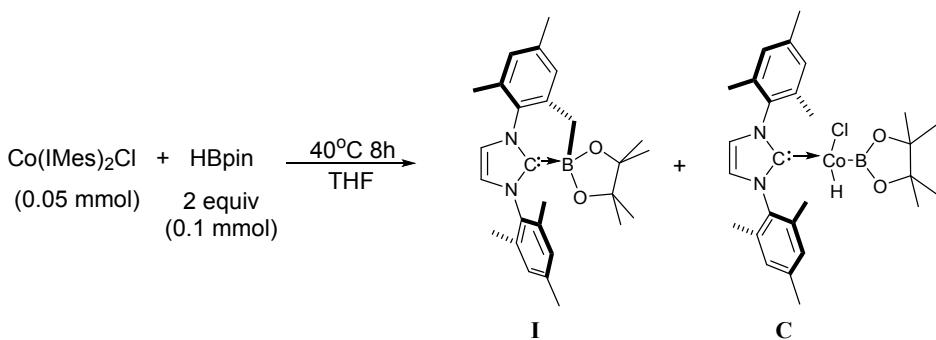

Figure S3. ^1H NMR spectra of (1) $\text{Co}(\text{IMes})_2\text{Cl}$, (2) Equimolar amount (0.025 mmol) of $\text{Co}(\text{IMes})_2\text{Cl}$ (17.5 mg) and HBpin (3.5 μl) in d_8 -THF after (2) $T= 15$ min, (3) 2h, (4) $T=12\text{h}$.

Experiment S3:

To find the possible *in situ* generating catalyst upon reaction between $\text{Co}(\text{IMes})_2\text{Cl}$ and HBpin , 0.05 mmol of $\text{Co}(\text{IMes})_2\text{Cl}$ (35.2 mg) and HBpin (7.1 μl) each were mixed in THF for 12 h and then analysed by HR-MS (ESI). Only compound **I** could be detected by HRMS. However, when 0.05 mmol of $\text{Co}(\text{IMes})_2\text{Cl}$ and 2 equiv of HBpin (0.10 mmol, 14.2 μl) were reacted in THF for 8 h at 40°C , HRMS of the reaction mixture shows the peaks corresponding to both **I** and **C**.

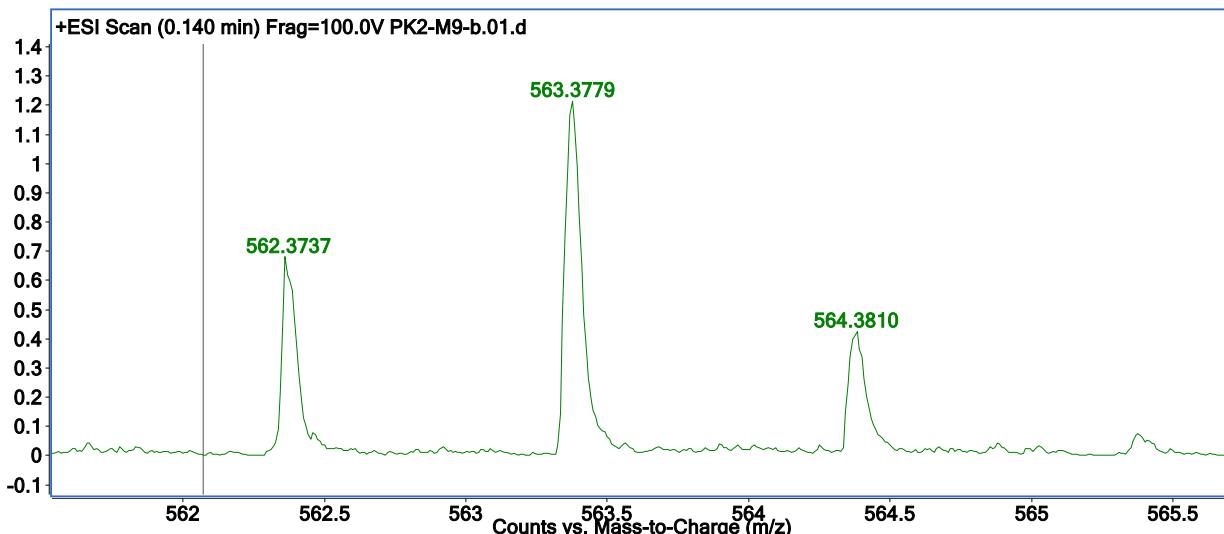

Figure S4. Mass Spectrum of complex **C**, $\text{Co}(\text{IMes})\text{HBpinCl}$ in THF, showing the ion peak at 563.3779 (m/z) which corresponds to $[(\text{M}-\text{Cl})+\text{C}_4\text{H}_8\text{O}]^+$. Calculated mass of the $[(\text{M}-\text{Cl})+\text{C}_4\text{H}_8\text{O}]^+$ is 563.2855 u.

Observation of the complex **C** reveals that first equivalent of HBpin reacts with $\text{Co}(\text{IMes})_2\text{Cl}$ to give **I** and $\text{Co}(\text{IMes})\text{Cl}$. Addition of another equivalent of HBpin undergoes oxidative addition on the *in situ* generated catalyst $\text{Co}(\text{IMes})\text{Cl}$ to give the $\text{Co}(\text{III})$ complex **C**, $\text{Co}(\text{IMes})\text{HBpinCl}$.

Experiment S4:

Equimolar amount (0.025 mmol) of Co(IMes)₂Cl (17.5 mg) and HBpin (2.5 μ l) were mixed in *d*₈-THF (0.4 ml). The reaction mixture was stirred at room temperature for 8 h. Addition of 0.025 mmol of styrene (2.75 μ l) in step 2 did not produce any change in the ¹H NMR spectrum. In step 3, addition of one equivalent of HBpin (0.025 mmol, 2.5 μ l) immediately produced the product.

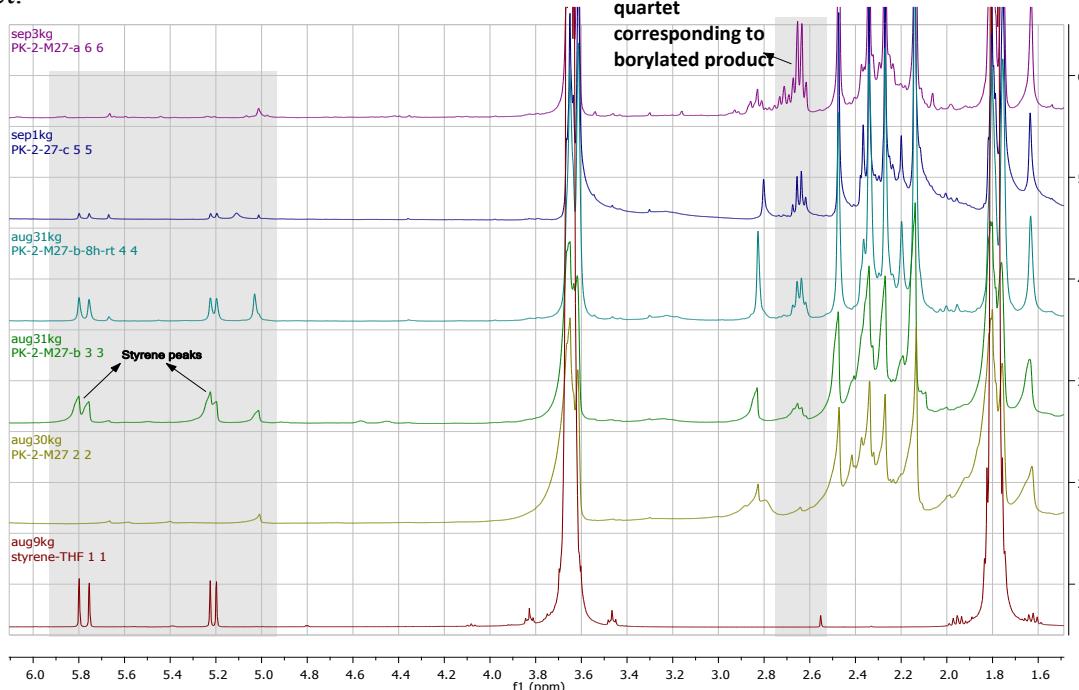

Figure S5. ¹H NMR spectra of (1) Styrene in THF, (2) Equimolar amount (0.025 mmol) of Co(IMes)₂Cl and HBpin in *d*₈-THF after 8 h at rt, (3) addition of 0.025 mmol of styrene, T = 10 min (4) at T = 30 min, (5) at T= 1 h (6) T = 2 h.

Experiment S5:

Equimolar amount of $\text{Co}(\text{IMes})_2\text{Cl}$ (0.05 mmol, 35.2 mg) and styrene (0.05 mmol, 5.7 μl) were mixed in THF. One equivalent of HBpin was added to the reaction mixture and stirred for 8 h at rt. Then another equivalent of HBpin was added. The reaction was followed by ^{11}B NMR. The spectra show that with one equivalent of $\text{Co}(\text{IMes})_2\text{Cl}$, styrene and HBpin, both the product and compound **I** formed. Next addition of HBpin to this mixture further increased the intensity of the peak corresponding to the product and **I**. The spectra shows that formation of **I** is accompanied by the formation of product; which further point out that HBpin reacts with $\text{Co}(\text{IMes})_2\text{Cl}$ to generate active catalyst and a by-product, compound **I**.

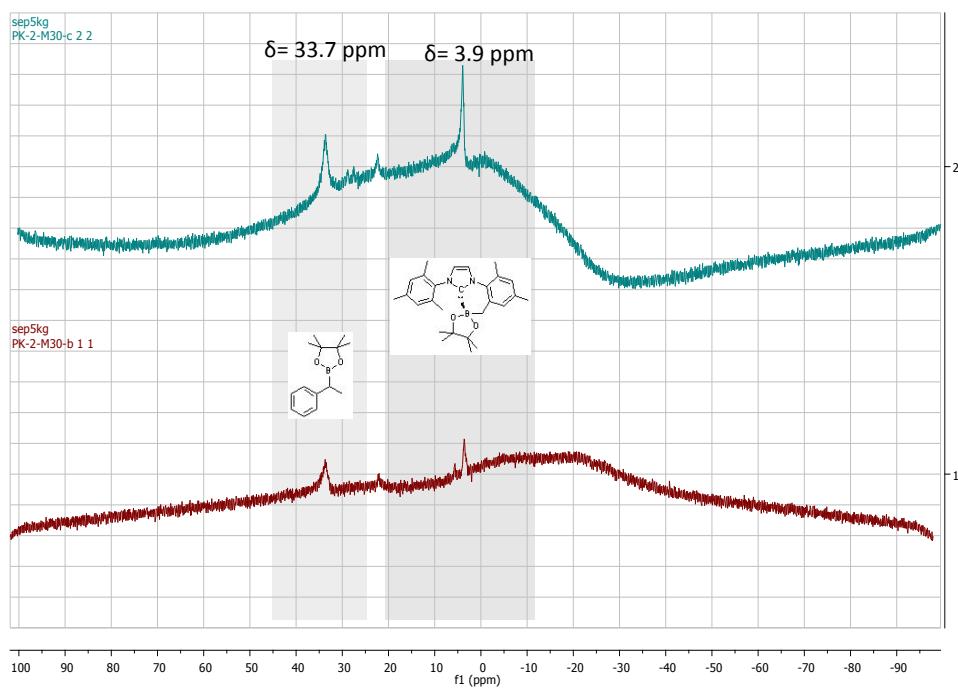

Figure S6. ^{11}B NMR spectra of (1) Equimolar amount (0.05 mmol) of $\text{Co}(\text{IMes})_2\text{Cl}$, styrene and HBpin in THF after 8 h, (2) addition of next 0.05 mmol of HBpin, after 8 h.

VI. Kinetic Study

Kinetic Experiments

Kinetics of hydroboration reaction was studied by performing NMR scale reactions. *trans*- β -methyl-styrene (**15**) was used as substrate for the kinetic study because no other isomeric product was found with HBpin and catalyst **A**, in benzene-*d*₆ as solvent. The reaction was monitored by ¹H NMR analysis at time interval of 25 min. Reactions were performed at 60°C temperature and long-time interval (25min) was chosen due to very slow progress of reaction in absence of stirring and benzene-*d*₆ as a solvent. The kinetic data were obtained by following the increment in the proton integral of β C-H (**13a**) relative to aromatic-H of mesitylene (internal standard).

General procedure for the rate determination:

In nitrogen atmosphere, required amount of Co- catalyst **A** and alkene **15** were taken along with mesitylene (5 μ l) and 0.5 ml benzene-d6. Required amount of HBpin was then transferred to the NMR tube and the reaction mixture was kept immediately in the ice bath. NMR was recorded at room temperature considering it at T= 0 min (no product was observed). Then NMR tube was kept in oil bath, 60°C temperature and spectra was recorded at the interval of 25 min.

Catalyst rate order assessment:

Varying concentration of catalyst **A** while keeping HBpin and alkene (**15**) concentration constant.

[Catalyst] (M)	[HBpin] (M)	[Alkene] (M)	Rate M/min	R ²
0.0060	0.20	0.20	$5.76 \times 10^{-4} \pm 1.64 \times 10^{-5}$	0.99674
0.0150	0.20	0.20	$7.80 \times 10^{-4} \pm 1.97 \times 10^{-5}$	0.99743
