1. Computational details

The electronic, magnetic, and crystal structures of LaMO_3 ($\text{M} = \text{Sc} - \text{Cu}$) perovskites used in the calculation are summarized in Table S1.

Table S1. Electronic, magnetic, and crystal structures of LaMO_3 ($\text{M} = \text{Sc} - \text{Cu}$) perovskites.

Perovskite	PAW potential	U_{eff} in PBE+U	U_{eff} in BEEF-vdW+U	Magnetic structure	Crystal structure (Orthorhombic & Rhombohedral)
LaScO_3	Sc_sv	0	0	NM ^a	$Pbnm$
LaTiO_3	Ti_pv	1.3	0.6	GAFM ^b	$Pbnm$
LaVO_3	V_sv	3.0	2.5	CAFM ^c	$Pbnm$

2. Determination of U_{eff} value

The U_{eff} ($U_{\text{eff}} = U - J$) values used in this work were obtained by fitting the calculated thermodynamic quantities, such as enthalpy and Gibbs free energy of formation of metal oxides, to available experimental data.

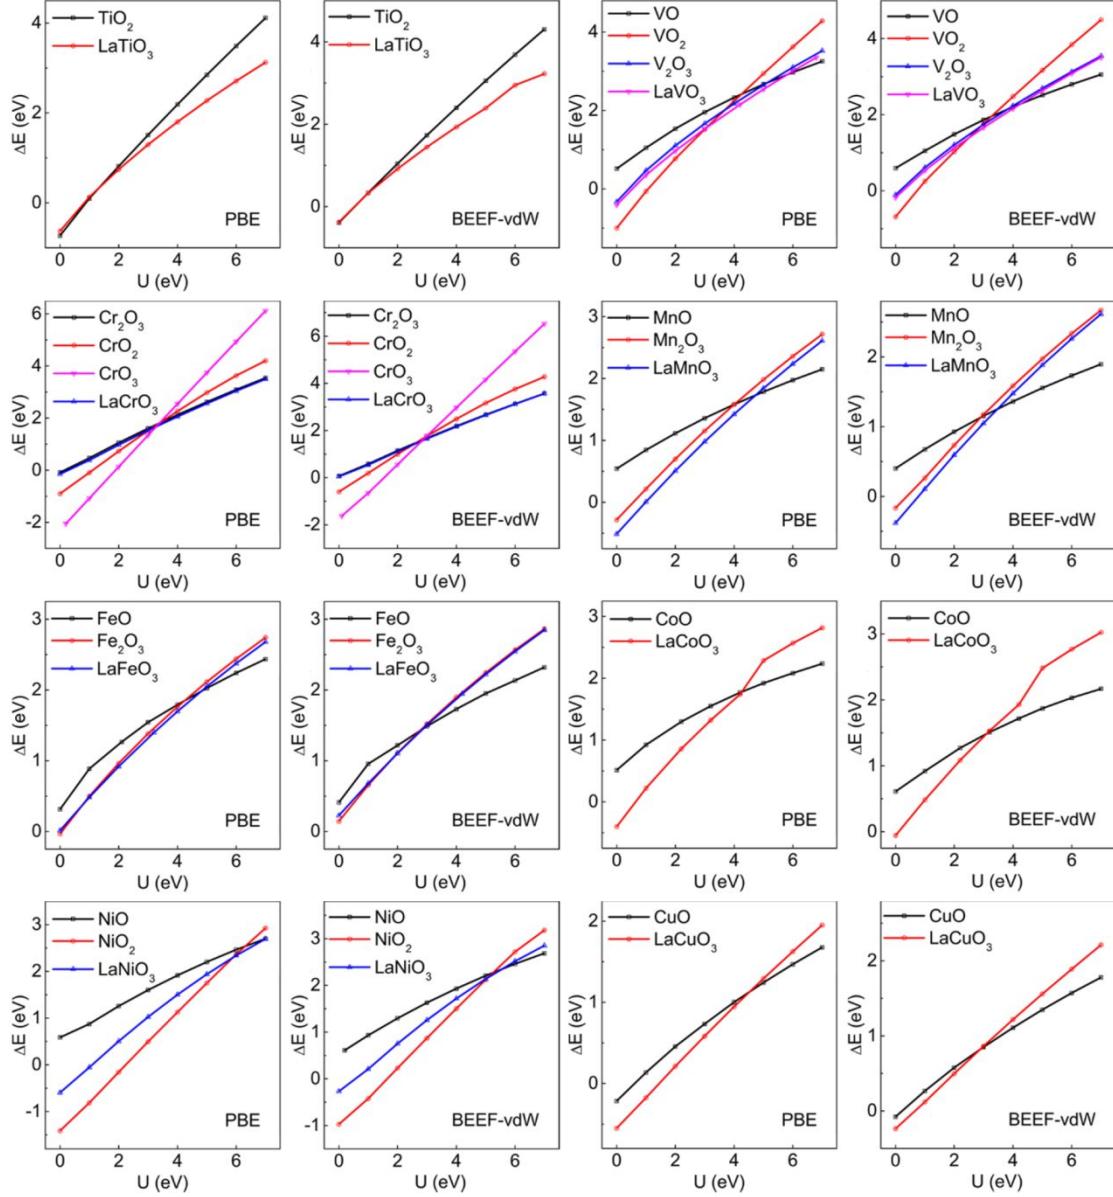

Figure S1. Derivation of the U_{eff} value by using the PBE and the BEEF-vdW functionals.

To ensure that the fitting to the thermodynamic properties can correctly reproduce other physical properties of LaMO₃, we calculated the band structures, band gaps, as well as magnetic moments of LaMO₃ (M = Sc - Cu) by using the BEEF-vdW+U method, as shown in Figs. S2 and S3,

respectively. Comparison between our calculated band gaps and magnetic moments with experimental data¹⁻²⁰ and theoretical results reported by using the HSE hybrid functional²¹⁻²⁶ indicates that our fitted U_{eff} values work surprisingly well when determining the physical properties of LaMO_3 , and, in some cases, BEEF-vdW+U may give even better agreement than the HSE hybrid functional does. The only exception occurs in LaScO_3 , whose band gap is considerably underestimated. This deviation can be traced to the underestimation of the Sc 3d unoccupied band energy, and the calculated error can only be corrected by using a large and unreasonable U_{eff} value because the U_{eff} within the GGA+U framework has a negligible effect on the energy of the unoccupied *d* state. Hence, in this work, BEEF-vdW+U was applied to the La-based perovskites involving 3*d*-block transition metals except LaScO_3 .

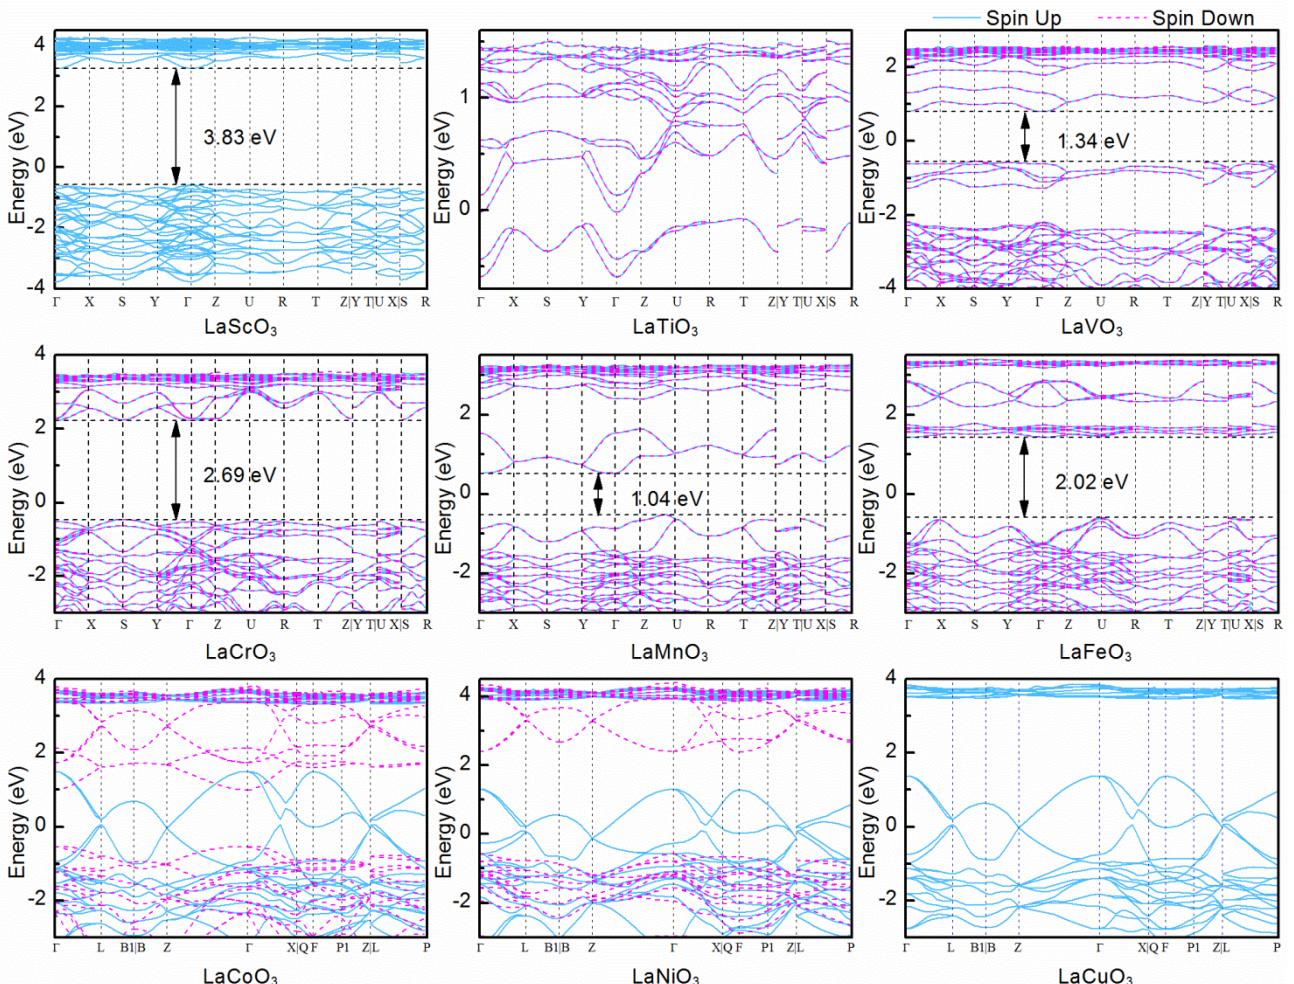

Figure S2. Calculated band structures of LaMO_3 ($M = \text{Sc} - \text{Fe}$) by BEEF-vdW+U.

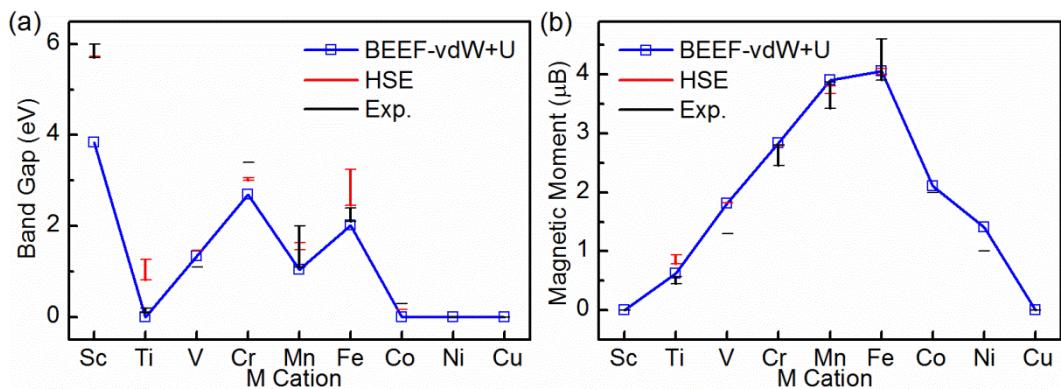

Figure S3. Calculated (a) band gap and (b) magnetic moment of La-based perovskites LaMO₃ (M = Sc - Fe) by BEEF-vdW+U. Experimental results reported in ref. 1-20 and theoretical data reported by using the HSE hybrid functional in ref. 21-26 are presented for comparison.

3. Structure distortion

Structural determinations carried out at room temperature suggested that there are multiple ways in which the octahedra can tilt. Very often perovskites would undergo an $a^-a^-a^-$ or an $a^-b^+a^-$ octahedral tilting distortion, with the symmetry reducing from cubic to rhombohedral or to orthorhombic, which can be seen from Fig. S4.

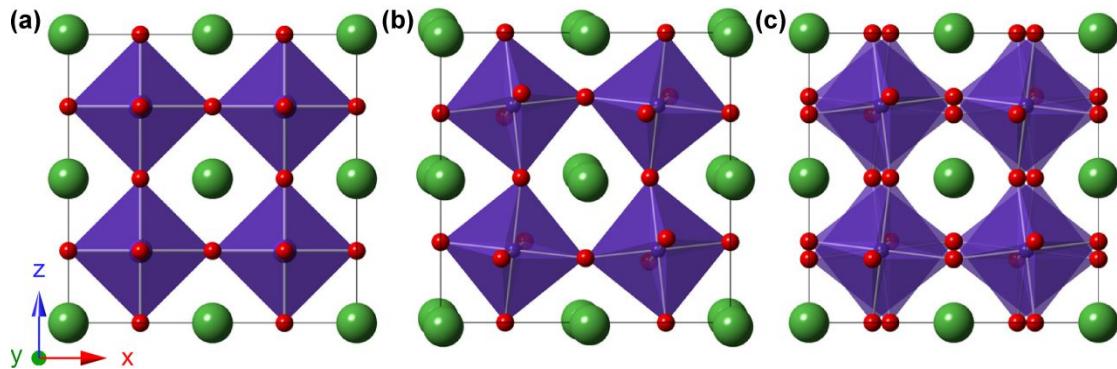

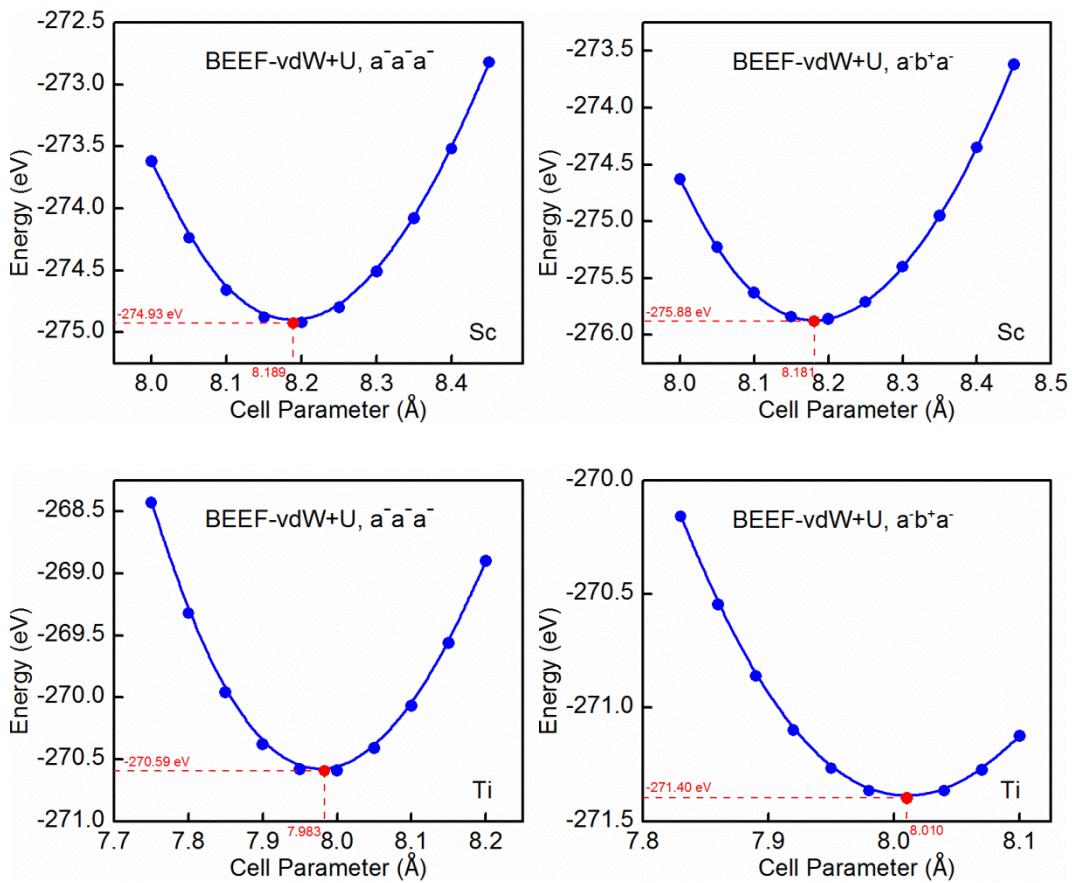

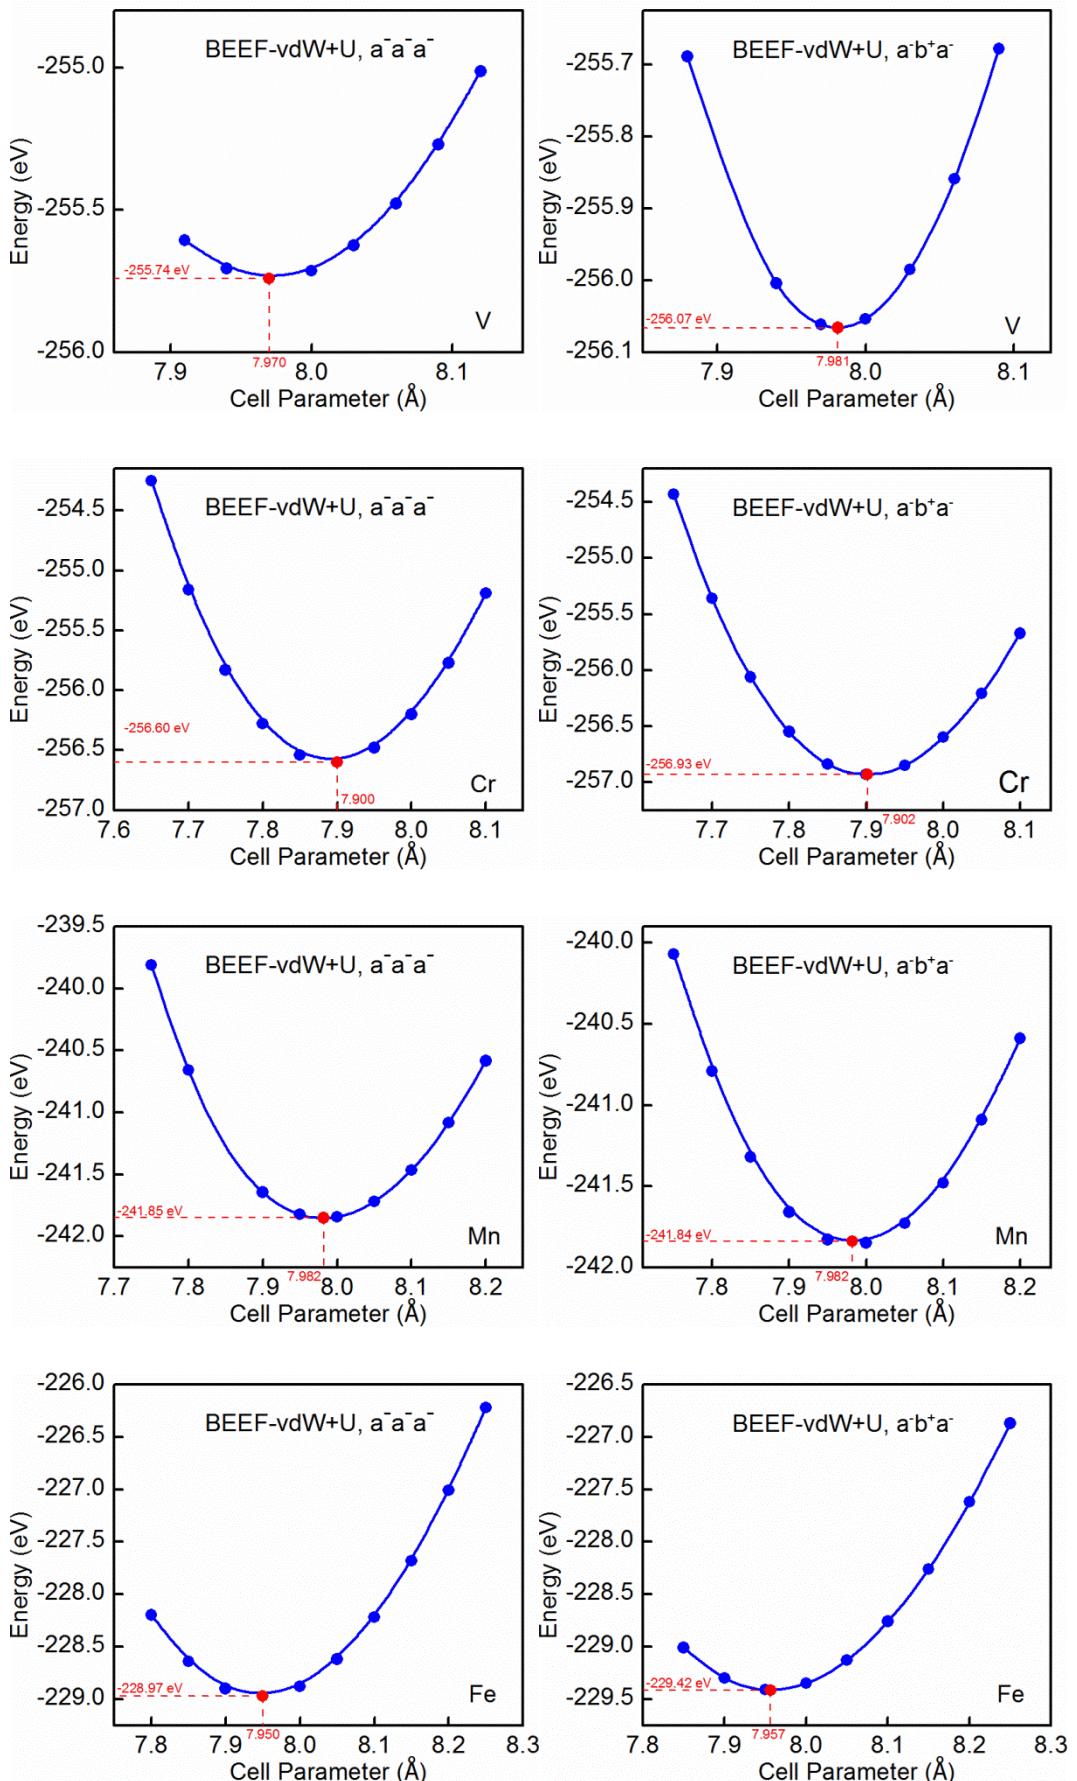

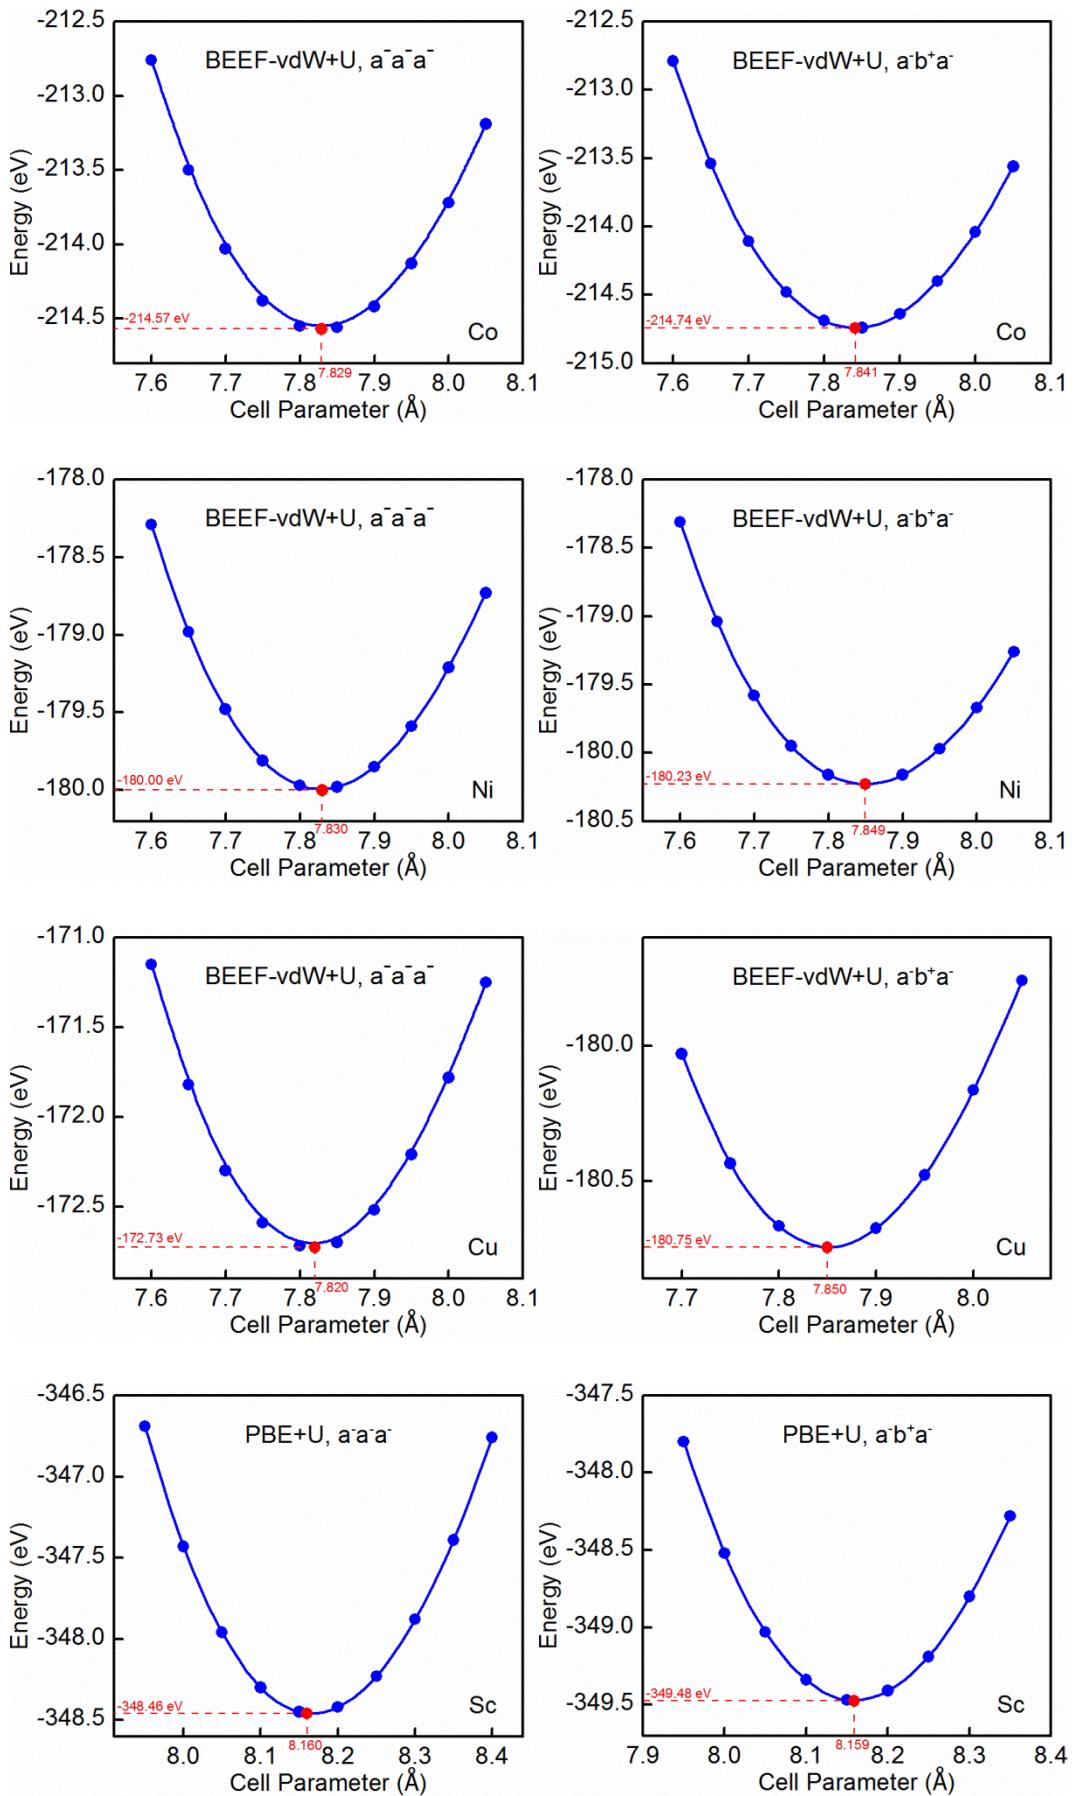

Figure S4. Schematic representations of (a) ideal cubic structure, (b) pseudocubic structure adopting the $a^-b^+a^-$ tilt system, and (c) pseudocubic structure adopting the $a^-a^-a^-$ tilt system.

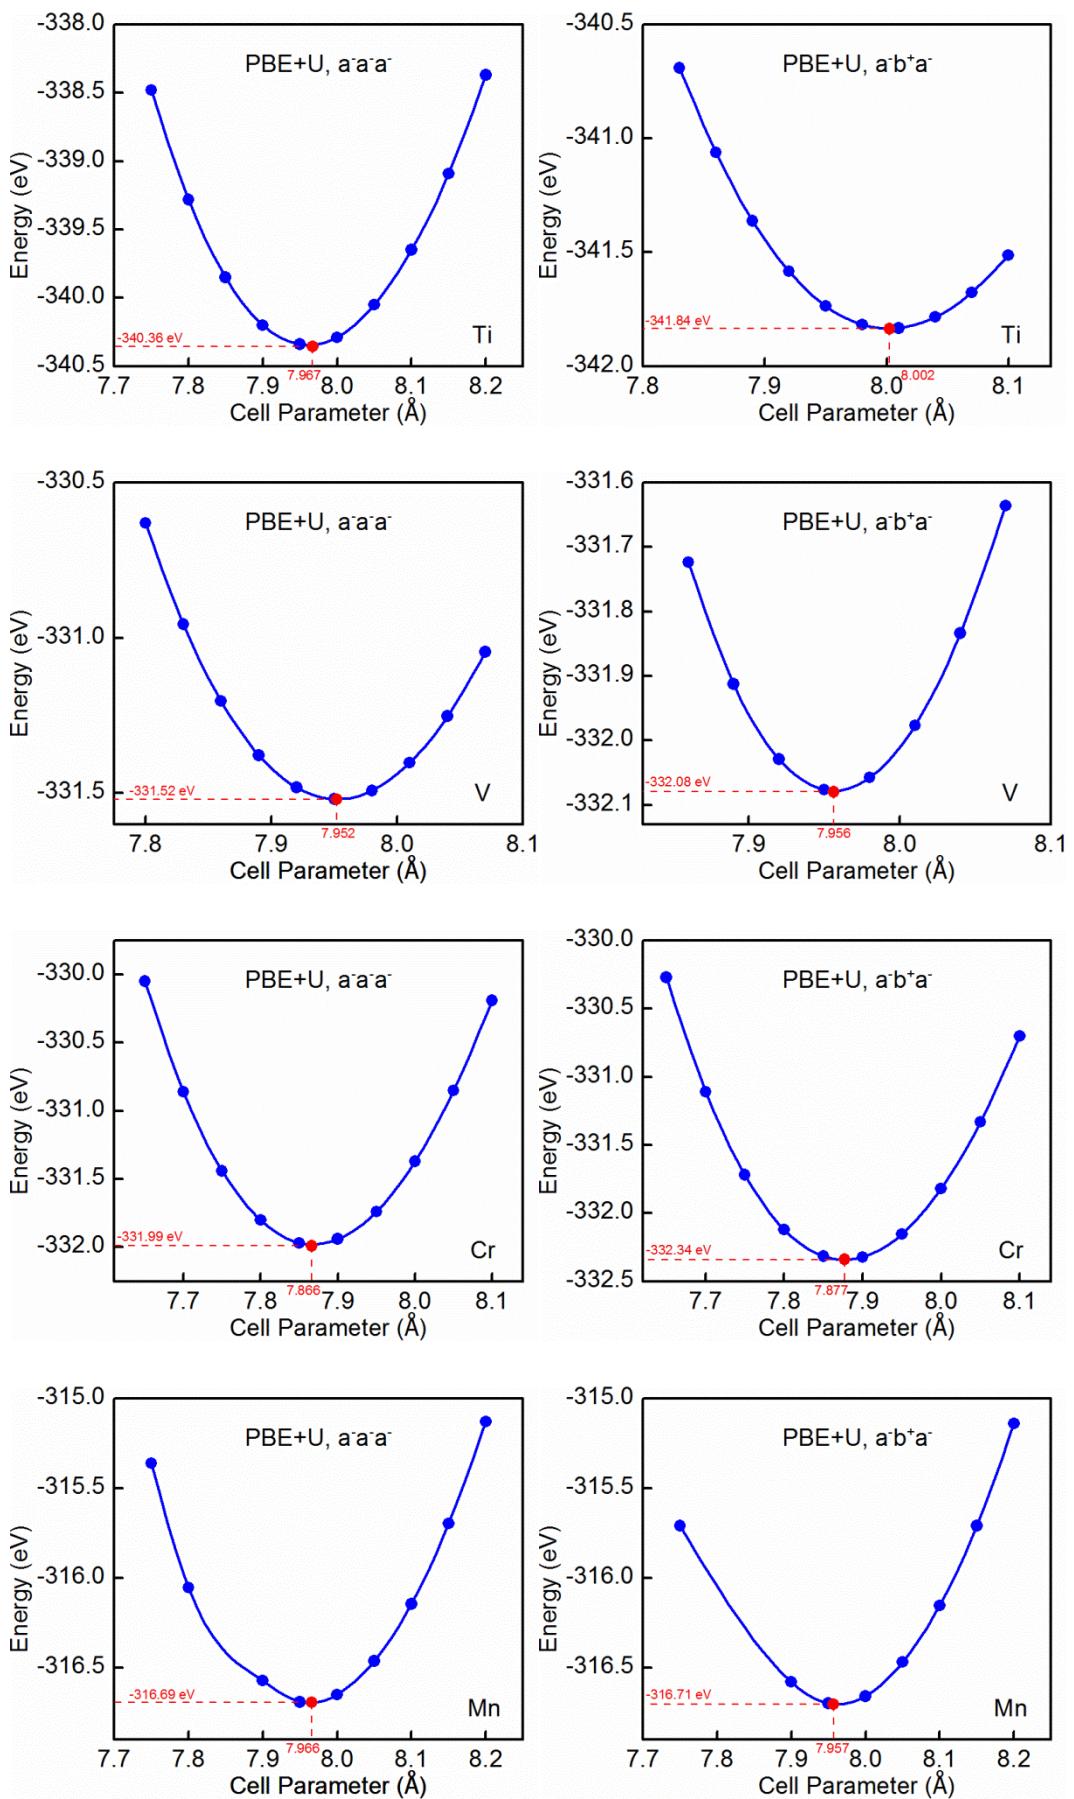

4. Cell parameters of pseudocubic structures of LaMO₃

Pseudocubic structures were obtained by imposing an $a^-b^+a^-$ or an $a^-a^-a^-$ octahedral tilting distortions on the cubic supercells and allowing for internal atomic relaxation. The equilibrium supercell parameters of the pseudocubic structures were obtained by first performing a series of constant-volume calculations and then fitting the energy vs. volume data to the Murnaghan equation of state (see Fig. S5). Our calculated results indicate that the pseudocubic model in the $a^-b^+a^-$ tilt system is energetically more favorable than that in the $a^-a^-a^-$ tilt system. Therefore, the $a^-b^+a^-$ octahedral tilting distortion was adopted by all the pseudocubic structures of La-based perovskites.

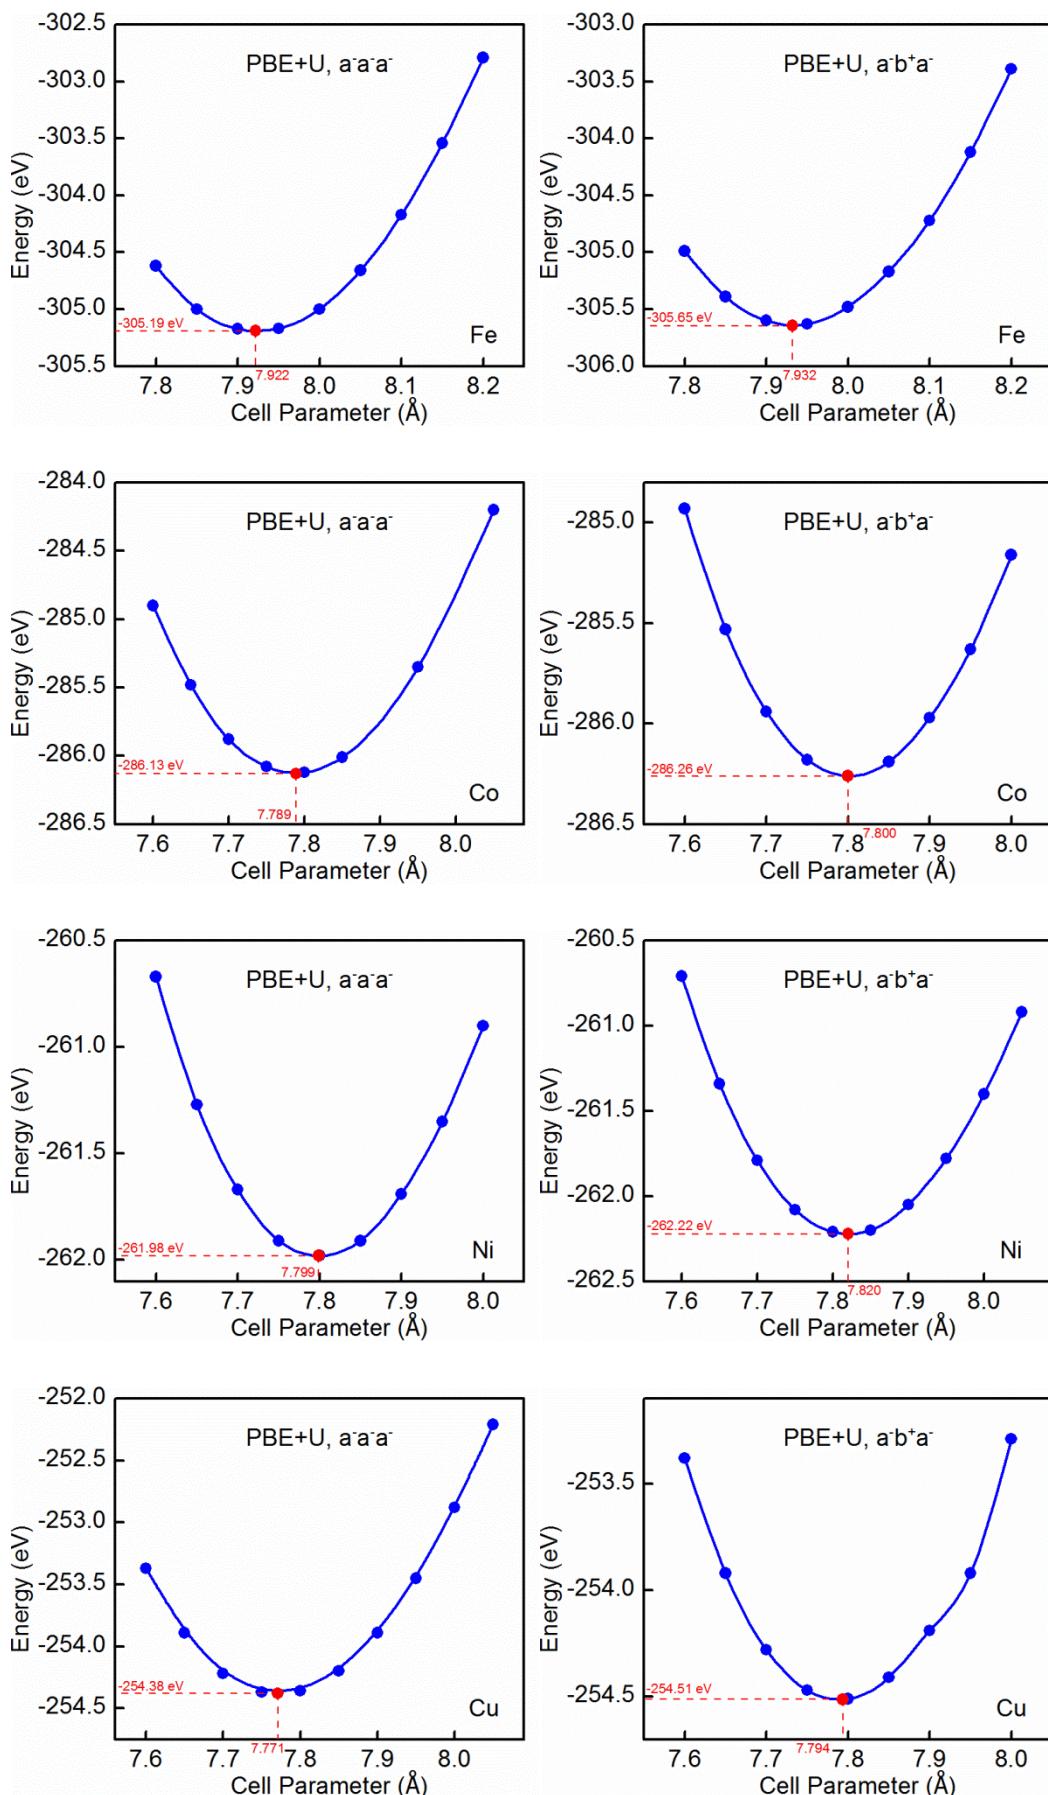

Figure S5. Determination of the cell parameters of pseudocubic structures of LaMO_3 .

5. O₂ binding energy correction

The calculated and experimental enthalpy and Gibbs free energy of formation of nontransition-metal oxides are compared and presented in Fig. S6, from which the corrections to the O₂ total energy are determined.

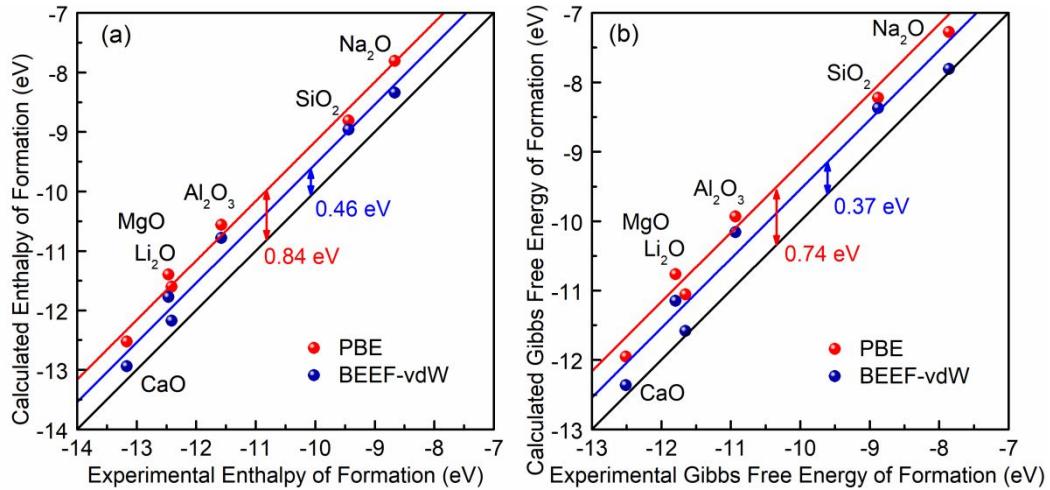

Figure S6. Plots of calculated (a) enthalpy and (b) Gibbs free energy of formation of non-transition metal oxides (*per* mole O₂ at 298 K) against experimental value.

6. Variation in the M-O_C-M bond angle

The octahedral rotation is commonly referred to as GdFeO₃-type distortion (or simply GFO distortion) and would considerably decrease the M-O_C-M bond angles from 180°, as summarized in Table S2.

Table S2. Measured M-O_C-M bond angles in LaMO₃.

Perovskites	M-O _c -M (Å)			
	BEEF-vdW+U		PBE+U	
	Pseudocubic	Orthorhombic & Rhombohedral	Pseudocubic	Orthorhombic & Rhombohedral

LaCuO ₃	158.206	160.384	161.816	161.640

7. Oxygen vacancy formation energy

The calculated oxygen vacancy formation energies in the three perovskite crystal structures by using the BEEF-vdW+U and PBE+U methods are presented in Table S3.

Table S3. Calculated oxygen vacancy formation energies in the three perovskite crystal structures by using the BEEF-vdW+U and PBE+U methods.

Perovskites	BEEF-vdW+U				PBE+U			
	Pseudocubic		Orthorhombic & Rhombohedral		Pseudocubic		Orthorhombic & Rhombohedral	
	O_{ab}	O_c	O_{ab}	O_c	O_{ab}	O_c	O_{ab}	O_c
LaScO ₃	7.07	7.08	7.10	7.10	7.10	7.11	7.12	7.13
LaTiO ₃	6.50	6.47	6.52	6.44	6.61	6.63	6.61	6.57
LaVO ₃	6.05	6.14	6.10	6.29	6.26	6.36	6.21	6.36
LaCrO ₃	5.49	5.51	5.42	5.48	5.61	5.62	5.54	5.59
LaMnO ₃	3.37	3.45	4.01	3.96	3.37	3.47	3.96	3.95
LaFeO ₃	4.77	4.81	4.74	4.76	4.90	4.94	4.79	4.89
LaCoO ₃	2.23	2.30	2.35		2.12	2.21		2.48
LaNiO ₃	1.54	1.59		1.49		1.50	1.55	
LaCuO ₃	1.36	1.43		1.16		1.19	1.25	

From Table S3, one can see that in the orthorhombic and pseudocubic LaMO₃ the calculated oxygen vacancy formation energies at the O_{ab} and O_c sites are virtually the same (the difference is less than 0.1 eV), implying that the oxygen vacancies are likely to be distributed uniformly in bulk perovskite. The only exception to this observation is LaVO₃, where the energy difference could be as high as 0.19 eV. The origin of the energy difference probably lies in the fact that LaVO₃ adopts a C-type antiferromagnetic structure and undergoes a significant GFO distortion in the *c* direction compared to the other perovskite materials, which is reflected in the dramatic reduction of the V- O_c -V bond angle from 180° (see Table S2 for details). As a consequence, the local magnetic and coordination environments of the O_{ab} and O_c ions differ significantly, which in turn gives rise to the markedly different V-O bond strengths.

8. Effective Bader charge on ions in stoichiometric perovskites

The calculated effective Bader charges on La (q_{La}), M (q_M), and O (q_O) in the stoichiometric LaMO_3 are presented in Table S4.

Table S4. Bader charge on different ions in stoichiometric perovskites.

9. Charge redistribution in perovskites upon oxygen vacancy formation

The percentage of the electrons gained by each remaining ion upon oxygen vacancy formation is calculated by using the PBE+U method and shown in Fig. S7. The percentage of the electrons gained by the three elements upon oxygen removal, together with the corresponding oxygen vacancy formation energy, in the pseudocubic and orthorhombic & rhombohedral LaMO_3 is listed in Table S5 and S6, respectively.

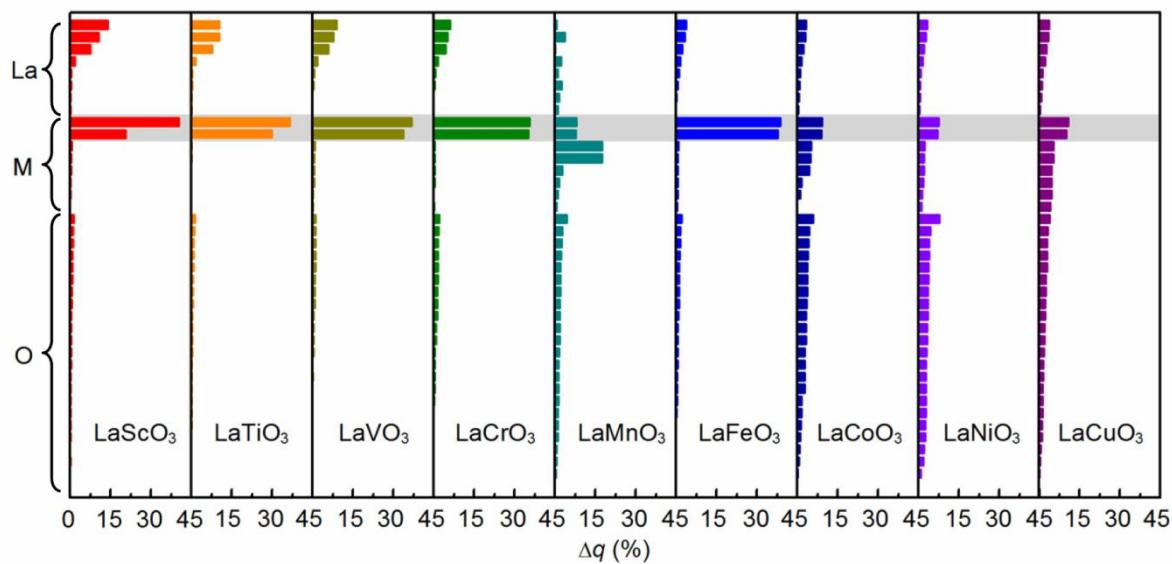

Figure S7. Percentage of the electrons gained by each remaining ion upon oxygen vacancy formation calculated by using the PBE+U method. The data for the nearest-neighbor transition metals of the oxygen vacancy are shaded in gray.

Table S5. Percentage of the electrons gained by each element in pseudocubic LaMO_3 upon oxygen removal.
