## General Considerations.

All manipulations of metal complexes were carried out in the absence of water and dioxygen using standard Schlenk techniques, or in an MBraun inert atmosphere drybox under a dinitrogen atmosphere. Ligand and ligand precursors were synthesized as previously reported. ${ }^{1}$ All glassware was oven dried for a minimum of 1 hour and cooled in an evacuated antechamber prior to use in the drybox. Benzene, $n$-hexane, toluene, and dichloromethane were dried over $4 \AA$ molecular sieves (Strem) prior to use. Chloroform- $d$ and deuterium oxide $\left(\mathrm{D}_{2} \mathrm{O}\right)$ were purchased from Cambridge Isotope Labs and used as received. Benzene- $d_{6}$ and pyridine- $d_{5}$ were purchased from Cambridge Isotope Labs and were degassed and stored over $4 \AA$ molecular sieves prior to use. Methylmagnesium bromide solution ( 3.0 M in diethyl ether), isopropylmagnesium chloride lithium chloride complex solution (1.3 M in THF), azidotrimethylsilane, palladium on carbon (10 $\mathrm{wt} \%$ ), benzaldehyde, trimethylamine, thionyl chloride, sodium borodeuteride, chlorodiphenylphosphine, 4-iodobenzotrifluoride, methyl-3-butenoate, tri(o-tolyl)phosphine, 4phenylbutanoic acid, 4-(p-tolyl)butanoic acid, 4-(4-methoxyphenyl)butanoic acid, and 2-methylhexan-2-ol were purchased from Aldrich and used as received. 2,5-dimethylhexan-2-ol and 3-methyl-3-trimethylsiloxy-1-butyne were purchased from Alfa Aesar and used as received. Boron trifluoride diethyl etherate, palladium(II) acetate, and cobalt(III) acetylacetonate were purchased from Strem and used as received. Methoxybenzoquinone (MBQ) was purchased from TCIAmerica and used as received. Pyridine, 4-tert-butylpyridine and 4-trifluoromethylpyridine were purchased from Aldrich, degassed and stored over $4 \AA$ molecular sieves prior to use. 4Dimethylaminopyridine was purchased from Aldrich and recrystallized from toluene prior to use. Anhydrous cobalt(II) bromide was purchased from Aldrich and used as received. Celite® 545 (J. T. Baker) was dried in a Schlenk flask for 24 h under dynamic vacuum while heating to at least $150{ }^{\circ} \mathrm{C}$ prior to use in a drybox. Silica gel $32-63 \mu$ (AIC, Framingham, MA) was used as received.

## Characterization and Physical Measurements.

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Varian Unity/Inova 500 MHz - or Agilent DD2 600 MHz spectrometers. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR chemical shifts are reported relative to $\mathrm{SiMe}_{4}$ using the chemical shift of residual solvent peaks as reference. Gas chromatography/mass spectrometry (GC/MS) was performed on an Agilent GC/MS 5975 Turbo system. High-resolution mass spectrometry was performed on a Bruker microTOFII ESI LCMS. Elemental analyses (\%CHN) were obtained on a PerkinElmer 2400 Series II CHNS/O Analyzer.

## Metal Complexes Syntheses.

## A. Synthesis of cobalt synthons.

( $\left.{ }^{\text {Ar}} \mathbf{L}\right) \mathbf{C o B r}$, (1): In an oven-dried 50 mL pressure vessel, ( $\left.{ }^{\mathrm{Ar}} \mathrm{L}\right) \mathrm{Li}(0.5 \mathrm{~g}, 0.57 \mathrm{mmol})$ and $\mathrm{CoBr}_{2}$ ( $0.137 \mathrm{~g}, 0.627 \mathrm{mmol}, 1.10$ equiv) were dissolved in 20 mL toluene and stirred for 15 hours at 125 ${ }^{\circ} \mathrm{C}$. The dark maroon mixture was filtered through a coarse glass frit with Celite to remove lithium chloride and excess cobalt. The Celite was washed with an additional 20 mL benzene. The collected filtrate was frozen and benzene was removed by sublimation in vacuo to afford $\mathbf{1}$ as a maroon powder ( $0.52 \mathrm{~g}, 90 \%$ ). Crystals suitable for X-ray diffraction were grown from a $2: 1 \mathrm{n}$ hexane/benzene mixture at $-35^{\circ} \mathrm{C}$. ${ }^{1} \mathbf{H}$ NMR ( $600 \mathrm{MHz}, 295 \mathrm{~K}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta / \mathrm{ppm} 94.31,91.62,26.23$, $24.02,18.59,13.83,13.27,12.64,12.41,2.12,-27.85,-36.76,-41.50$. ( ${ }^{\text {Ar}} \mathbf{L}$ )Co, (2): In a 20 mL vial, $\mathbf{1}(0.5 \mathrm{~g}, 0.496 \mathrm{mmol})$ was dissolved in 10 mL of benzene and added to a frozen benzene solution of potassium graphite ( $\mathrm{KC}_{8}, 0.074 \mathrm{~g}, 0.545 \mathrm{mmol}, 1.1$ equiv). The reaction mixture was slowly warmed up to room temperature and stirred for 3 hours at room temperature. The dark purple mixture was filtered through a coarse glass frit with Celite. The Celite was washed with an additional 20 mL benzene. The collected filtrate was frozen and benzene removed by sublimation in vacuo to afford 2 as a dark purple powder. ( $0.4 \mathrm{~g}, 87 \%$ ). Crystals suitable for X-ray diffraction were grown from a $2: 1 n$-hexane/benzene mixture at $-35{ }^{\circ} \mathrm{C} .{ }^{1} \mathbf{H}$ NMR ( $600 \mathrm{MHz}, 295 \mathrm{~K}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta / \mathrm{ppm} 45.11,14.12,13.68,12.41,8.16,7.58,5.13,1.35,-1.55$, -16.71. ## Organoazide Syntheses.

## General procedures for preparation of organoazides.

Procedure A: Catalytic amount of concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ was added to a solution of the corresponding 4-phenylbutanoic acid (1 equiv) in 50 mL methanol. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 12 hours. Upon completion, the reaction mixture was concentrated and diluted in $\mathrm{Et}_{2} \mathrm{O}$. The aqueous phase was extracted three times with $\mathrm{Et}_{2} \mathrm{O}$ and the combined organic phases were washed with brine, dried over $\mathrm{MgSO}_{4}$, filtered and concentrated. The product was used without further purification.

Procedure B: An oven-dried Schlenk flask was charged with 3 g of the corresponding methyl 4phenylbutanoate in dry $\mathrm{Et}_{2} \mathrm{O}$ and placed under $\mathrm{N}_{2}$. The solution was cooled in an ice-bath and a diethyl ether solution of methylmagnesium bromide ( 3.0 M in diethyl ether) was added slowly at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred at room temperature for 3 hours before it was quenched with a saturated aqueous solution of $\mathrm{NH}_{4} \mathrm{Cl}$ and diluted with water. The aqueous phase was extracted three times with diethyl ether. The combined organic phases were washed with brine, dried over $\mathrm{MgSO}_{4}$, filtered and concentrated. The product was used without further purification.

Procedure C: (adapted from literature procedure) ${ }^{2}$ : An oven-dried Schlenk flask was charged with a tertiary alcohol ( $15 \mathrm{mmol}, 1$ equiv) and azidotrimethylsilane ( 1.2 equiv) in benzene ( 0.5 M ) under $\mathrm{N}_{2}$. Boron trifluoride diethyl etherate ( 1.2 equiv) was added dropwise at $25^{\circ} \mathrm{C}$ to the stirring solution. After 24 hours, the mixture was poured into water and extracted three times with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic phases were washed with brine and dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated. The crude products were purified via silica gel chromatography ( $100 \%$ hexanes as an eluent) and stored over molecular sieves for further use.

## D. Synthesis of (4-azido-4-methylpentyl-1,1- $d_{2}$ )benzene.

(1) 4-phenylbutanoic-4,4- $\boldsymbol{d}_{\mathbf{2}}$ acid: The procedure was modified from a previously reported preparation. ${ }^{5}$ A 50 mL Schlenk flask was charged with 4-phenylbutanoic acid ( $3 \mathrm{~g}, 1.0$ equiv) and $10 \% \mathrm{Pd} / \mathrm{C}(0.3 \mathrm{~g}, 10 \mathrm{wt} \%)$ with $12 \mathrm{~mL}_{2} \mathrm{O}$. The reaction flask was fitted with a balloon full of $\mathrm{H}_{2}$ and purged with $\mathrm{H}_{2}$ three times. The resulted black suspension was heated at $50^{\circ} \mathrm{C}$ for 24 hours. After 24 hours, the reaction mixture was filtered through Celite to remove $\mathrm{Pd} / \mathrm{C}$ and washed with diethyl ether. The aqueous phase was extracted three times with diethyl ether. The combined organic phases were washed with brine, dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated. The product was used without further purification. The deuterium content ( $93 \%$ ) was determined by ${ }^{1} \mathrm{H}$ NMR integration of methyl groups to the benzylic hydrogens. ${ }^{1} \mathbf{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ) $\delta / \mathrm{ppm}: 12.1$ (br, s, 1 H ) 7.13 (t, 2 H ), 7.06 (t, 1 H ), 6.97 (d, 2 H ), 2.01 (t, 2 H ), $1.70(\mathrm{t}, 2 \mathrm{H}) .{ }^{13} \mathbf{C}\left\{{ }^{\mathbf{1}} \mathbf{H}\right\} \mathbf{N M R}$ $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta / \mathrm{ppm}: 179.9,141.2,128.6,128.5,126.2,34.4$ (quint, $J_{\mathrm{C}-\mathrm{D}}=18.1 \mathrm{~Hz}$ ), 33.3 , 26.2. ## Mechanistic Studies.

General considerations for kinetic experiments. All kinetic experiments were run in J Young nmr tubes at the noted temperature. Stock solutions of ( $\left.{ }^{\text {Ar }} \mathrm{L}\right) \mathrm{Co} 2$, azide substrate 7, and pyridine$d_{5}$ were prepared in benzene- $d_{6}$ and were added separately with a micro-syringe to the J Young tube. The reaction mixture was frozen prior to NMR analysis. The frozen reaction mixture was thawed and placed into a thermally stabilized NMR instrument. Reactions were monitored to less than $10 \%$ of product (2,2-dimethyl-5-phenylpyrrolidine) 9 formation. ${ }^{1} \mathrm{H}$ NMR data collection was done by using the array command, collecting spectra every 15 or 30 seconds. The resulting data points were analyzed using the initial rate method assuming the concentration of the cobalt imido $\mathbf{8}$ is constant during early stages of catalytic reactions. Each experiment was conducted in triplicate and average rates are reported with error bars corresponding to standard errors of those three experiments. 1,3,5-trimethoxybenzene was used as internal standard for ${ }^{1} \mathrm{H}$ NMR integration.
A. Order in imido. The reaction order in imido $\mathbf{8}$ was determined using the initial rate method with four different [2] and constant [7] at $50^{\circ} \mathrm{C}$ in benzene- $d_{6}$. A plot of rate versus [8] gave a straight line $\left(R^{2}=0.9988\right)$, indicating first order dependence on $[8]$.

Figure S-1. Rate of formation of $\mathbf{9}(\mathrm{mM} / \mathrm{min})$ versus concentrations of imido $\mathbf{8}(\mathrm{mM})$.

Table S-1. Averages and standard errors for the observed initial rates with varying concentrations of imido. The concentrations of imido $\mathbf{8}$ were calculated based on the initial amount of $\mathbf{2}$ assuming a quantitative conversion of $\mathbf{2}$ to $\mathbf{8}$.

D. Formation of cobalt tetrazido complex as a function of [pyridine- $\boldsymbol{d}_{5}$ ]. The rate of formation of $\mathbf{1 1}$ as a function of [pyridine- $d_{5}$ ] was measured at $25^{\circ} \mathrm{C}$ in benzene- $d_{6}$ with $[\mathbf{1 0}]=8.50 \mathrm{mM}$, $\left[\mathbf{N}_{3} \mathbf{A d}\right]=85.0 \mathrm{mM}$, and varying concentrations of pyridine- $d_{5}$.

Figure S-4. Formation of cobalt tetrazido complex as a function of [pyridine- $d_{5}$ ] (a) Each reaction was monitored up to $>\mathbf{7 5 \%}$ formation of $\mathbf{1 1}$. Black dashed line represents the [11] at full conversion indicating an empirically determined constant infinity point. (b) Averages of triplicate results measured up to $60 \%$ formation of $\mathbf{1 1}$. Error bars depict standard errors. Black lines represent fittings to a $6^{\text {th }}$ polynomial, where $c_{0}, c_{1}, c_{2} \ldots c_{6}$ are constants, to obtain the overall rates at $50 \%$ formation of $\mathbf{1 1} .{ }^{15}$

A solution of $\left({ }^{\text {Ar }} \mathrm{L}\right) \mathrm{Co}(\mathrm{NAd}) \mathbf{1 0}$ was prepared in benzene- $d_{6}$ and its concentration was maintained constant throughout the titration with pyridines. The chemical shifts corresponding to $\mathbf{1 0}$ as a function of the concentration of pyridines were fitted with a $1: 1$ binding isotherm by solving the following equations: (1)-(4); $[\mathbf{M}] 0$ is the total concentration of $\mathbf{1 0}$ and the corresponding pyridine-bound imido $\mathbf{1 0} \mathbf{- p y}$; [L] $]_{0}$ is the total concentration of pyridine; [ML] is the concentration of $\mathbf{1 0 - p y ;}[\mathbf{M}]$ is the concentration of $\mathbf{1 0}$; [L] is the concentration of free pyridine. $\boldsymbol{\delta}_{\text {ree }}$ is the chemical shift of $\mathbf{1 0} ; \boldsymbol{\delta}_{\text {bound }}$ is the chemical shift of $\mathbf{1 0}$ py. $\boldsymbol{\delta}_{\text {bound }}$ is estimated and obtained by fitting the titration curve. ${ }^{16}$

## J. Intramolecular kinetic isotope effect.

(A) The KIE obtained upon the intramolecular competition was determined by measuring the ratio between the $\mathrm{P}_{\mathrm{H}}$ and $\mathrm{P}_{\mathrm{D}}$ using ${ }^{1} \mathrm{H}$ NMR integration. In order to completely exclude the off-cycle reaction (i.e., formation of the tetrazido complex) this experiment was performed using a stoichiometric amount of ( $\left.{ }^{\text {Ar }} \mathrm{L}\right) \mathrm{Co} 2$. A KIE value of 2.70(7) was found.

## Characterization of Substituted Pyrrolidines.

Catalytic reactions. Under $\mathrm{N}_{2}$ atmosphere, ( $\left.{ }^{\mathrm{Ar}} \mathrm{L}\right) \mathrm{Co}(8.50 \mathrm{mM}$ in benzene) and the desired 4phenyl substituted azide ( 10 equiv, 85.0 mM in benzene) were added to an oven-dried pressure vessel. The reaction mixture was heated to $80^{\circ} \mathrm{C}$ for 12 hours. The crude reaction mixture was concentrated via rotary evaporation and the desired substituted pyrrolidine was isolated via a flash silica chromatography using (EtOAc:MeOH:NH4OH $=10: 1: 0.1$ ) as an eluent. Since the purpose of such catalytic runs was to characterize the desired pyrrolidines from the corresponding azide substrate which are used for the kinetic analysis, the reactions were not conducted under the optimized conditions (i.e., in the presence of pyridie).

## X-Ray Diffraction Techniques.

All structures were collected on a Bruker three-circle platform goniometer equipped with an Apex II CCD and an Oxford cryostream cooling device. Radiation was from a graphite fine focus sealed tube Mo $\mathrm{K} \alpha(0.71073 \AA)$ source. Crystals were mounted on a cryoloop or glass fiber pin using Paratone N oil. Structures were collected at 100 K . Data was collected as a series of $\varphi$ and/or $\omega$ scans. Data was integrated using SAINT ${ }^{21}$ and scaled with either a numerical or multi-scan absorption correction using SADABS ${ }^{19}$. The structures were solved by direct methods or Patterson maps using SHELXS-97 ${ }^{22}$ and refined against $F^{2}$ on all data by full matrix least squares with SHELXL-97 ${ }^{20}$. All non-hydrogen atoms were refined anisotropically. Hydrogen atoms were placed at idealized positions and refined using a riding model. The isotropic displacement parameters of all hydrogen atoms were fixed to 1.2 times the atoms they are linked to (1.5 times for methyl groups). Further details on particular structures are noted below.

## Computational Methods.

Computations were carried out utilizing the ORCA 4.0.1.2 program package. ${ }^{23}$ All calculations employed the def2-TZVP ${ }^{24}(\mathrm{Co}, \mathrm{N})$ and def2-SV $(\mathrm{P})^{25}(\mathrm{C}, \mathrm{H})$ basis sets. Further, the def2-TSVP/J $(\mathrm{Co}, \mathrm{N})$ and def2-SV(P)/J (C, H) auxiliary basis sets were employed to utilize the RIJCOSX ${ }^{26}$ approximation for accelerating the calculation. The B3LYP ${ }^{27}$ functional was chosen based on good agreement of the optimized structure of $\mathbf{1 0}$ with its crystallographic data.
