## Syntheses

Reactions were monitored by thin layer chromatography when applicable with 0.25 mm silica gel plates ( $60 \mathrm{~F}-$ 254. E. Merck) and revealed with phosphomolybdic acid $5 \%$ weight in ethanol. 'H NMR spectra were recorded in 5 mm diameter tubes with a Bruker spectrometer ( $\left.{ }^{1} \mathrm{H} 400 \mathrm{MHz} .{ }^{13} \mathrm{C} 100 \mathrm{MHz}\right)$, in $\mathrm{CDCl}_{3}$. acetone D6 or DMSO D6 (for compound 2) at $25^{\circ} \mathrm{C}$. The chemical shift scale expressed in ppm was calibrated on the basis of the deuterated solvent or tetramethylsilane as reference. High resolution mass spectra were recorded on a Waters Micro-TOF-Q and Q-2.

Pent-4-en-1-yl(trityl)sulfane 8. To a solution of tritylthiol ( $19.49 \mathrm{~g}, 70.5 \mathrm{mmol}$ ) and bromide $(10.51 \mathrm{~g}$, $70.5 \mathrm{mmol})$ in $\mathrm{ACN}(350 \mathrm{~mL})$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}(73.1 \mathrm{~g}, 7.5 \mathrm{eq}$.). After stirring overnight at room temperature the solution was diluted with water ( 200 mL ) and extracted $\left(\mathrm{Et}_{2} \mathrm{O}, 3 * 200 \mathrm{~mL}\right)$. The combined organic layers were dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated under vacuum. Purification (Flash chromatography silica gel PE:EA 98:2) gave the expected compound $\mathbf{8}$ as a yellow oil ( $23 \mathrm{~g}, 92 \%$ ). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta \mathrm{ppm}: 1.49(\mathrm{~m}, 2 \mathrm{H}), 2.03$ $(\mathrm{m}, 2 \mathrm{H}), 2.18(\mathrm{t}, 2 \mathrm{H}, \mathrm{J}=7.33 \mathrm{~Hz}), 4.94(\mathrm{~m}, 2 \mathrm{H}), 5.67(\mathrm{~m}, 1 \mathrm{H}), 7.22(\mathrm{~m}, 3 \mathrm{H}), 7.30(\mathrm{~m}, 6 \mathrm{H}), 7.44(\mathrm{~m}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta \mathrm{ppm}: 27.9,31.4,33.0,66.5,115.0,126.5,127.8,129.6,137.8,145.0$.
(Z/E)-1,8-bis(tritylthio)oct-4-ene 9. Grubbs I catalyst ( 60 mg ) in DCM ( 3 mL ) was added over $6 \mathrm{~h}(0.5 \mathrm{~mL} / \mathrm{h}$ rate) to a boiling solution of $\mathbf{8}(130 \mathrm{mg}, 0.38 \mathrm{mmol})$ in $\mathrm{DCM}(3 \mathrm{~mL})$. The cool solution was then purified (Flash chromatography silica, PE/EA 100/0 ( 100 mL ), $95 / 5(250 \mathrm{~mL}), 90 / 10(250 \mathrm{~mL}), 85 / 15(500 \mathrm{~mL})$ ) and gave 9 $(107 \mathrm{mg}, 86 \%)$ as a brown oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta \mathrm{ppm}: 1.30(\mathrm{~m}, 2 \mathrm{H}), 1.79(\mathrm{~m}, 2 \mathrm{H}), 2.02(\mathrm{t}, 2 \mathrm{H}, \mathrm{J}=7.7 \mathrm{~Hz})$, $5.05(\mathrm{~m}, 1 \mathrm{H}), 7.11(\mathrm{~m}, 3 \mathrm{H}), 7.18(\mathrm{~m}, 6 \mathrm{H}), 7.32(\mathrm{~m}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right) \delta \mathrm{ppm}: 27.4,30.4,30.7,65.4$, 125.5, 126.8, 126.9, 128.6, 144.0. Methyl 1-(pent-4-en-1-yloxy)-2-naphthoate 12. To a solution of phenol $11(2 \mathrm{~g}, 10 \mathrm{mmol})$ in DMF ( 10 mL ) was added pentenylbromide ( $1.2 \mathrm{~mL}, 10 \mathrm{mmol}$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}(1.34 \mathrm{~g}, 10 \mathrm{mmol})$ and $\mathrm{NaI}(1.5 \mathrm{~g}, 10 \mathrm{mmol})$. After stirring overnight at ambient temperature the reaction is almost complete. $\mathrm{NaI}(10 \mathrm{mmol})$ was added and 12 h more stirring gave total reaction. Saturated aqueous NaCl was added $(100 \mathrm{~mL})$ and the mixture extracted $\left(\mathrm{Et}_{2} \mathrm{O}, 3 \times 100 \mathrm{~mL}\right)$. The combined organic layers were dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated. Purification (Flash chromatography silica, PE/EA 100/0 $(100 \mathrm{~mL}), 95 / 5(250 \mathrm{~mL}), 90 / 10(250 \mathrm{~mL}), 85 / 15(500 \mathrm{~mL})$ ) gave the ether as a brown oil $(2.4 \mathrm{~g}, 91 \%) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta \mathrm{ppm}$ : $2.06(\mathrm{~m}, 2 \mathrm{H}), 2.35(\mathrm{~m}, 2 \mathrm{H}), 3.96(\mathrm{~s}, 3 \mathrm{H})$, $4.12(\mathrm{t}, 2 \mathrm{H}, \mathrm{J}=6.6 \mathrm{~Hz}), 5.09(\mathrm{~m}, 2 \mathrm{H}), 5.93(\mathrm{~m}, 1 \mathrm{H}), 7.55(\mathrm{~m}, 3 \mathrm{H}), 7.83(\mathrm{~m}, 2 \mathrm{H}), 8.26(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100

## Biology

HDAC profiling
Compounds were tested in vitro for their inhibitory effect of HDACs (1 to 11) and sirtuins $(1-3,6)$ on lysine deacetylation on the platform at Cerep/Eurofins (Celle L’Evescault, France). Briefly, each recombinant HDAC was incubated with its fluorogenic acetylated substrate in presence or absence of the tested compound, and acetylation was further measured by fluorometry. Reference compounds include TSA for HDAC1-10, Scriptaid for HDAC11, suramin for sirtuin1-2, niacinamide for sirtuin3, EX-527 for sirtuin6.

## Cell culture

The human pleural mesothelial cell line, MeT-5A and the human lung cancer cell line, A549 were obtained from ATCC. The mesothelioma, Meso13, Meso 163, and adenocarcinoma (ADCA) ADCA 72 cell lines were established from the pleural fluids of mesothelioma or lung ADCA patients, respectively. Cell lines were characterized by measuring mRNA expression of usual mesothelioma (P16, Podoplanin, keratin 5, Wilm's Tumor antigen-1 (WT-1) and calretinin) and lung ADCA (Thyroid Transcription Factor-1 (TTF-1), Epithelial cell adhesion molecule (EPCAM) and Carcinoembryonic Antigen Related Cell Adhesion Molecule 1 (CEACAM-1)) differential markers (Gueugnon et al., Am J of Pathol, 2011). All cell lines were maintained in RPMI medium (Invitrogen) supplemented with 2 mM L-glutamine, $100 \mathrm{IU} / \mathrm{ml}$ penicillin, $0.1 \mathrm{mg} / \mathrm{ml}$ Streptomycine and $10 \%$ heat inactivated fetal calf serum (FCS) (Eurobio).

BRET experiments.
Principle for the global HDAC inhibition in cells by BRET assay.
A bioluminescence resonance energy transfer is used in this assay, the luminescence being obtained directly in living cells transfected with a histone H3 tagged with a yellow fluorescent protein, the counterpart being a bromodomain tagged with Renilla luciferase, and coelenterazine is used as the reagent for luminescence activation.

Transfections- MeT-5A cells were seeded at a density of $2.5 \times 10^{5}$ cells per 35 mm dish. Transient transfections were performed 1 day later using Attractene (Qiagen), according to the manufacturer's protocol. MeT-5A cells were transfected with $0.6 \mu \mathrm{~g}$ Rluc-Brd cDNA and $1.2 \mu \mathrm{~g}$ YFP-fused histone H 3 cDNA . One day after transfection, cells were transferred into 96 -well microplates (microplate 96 well, white, Berthold Technologies) at a density of $3 \times 10^{4}$ cells per dish. After 8 h , cells were treated with the different compounds. The following day, BRET measurements were performed as described below.
BRET measurements- All BRET measurements were performed at room temperature using the Mithras LB 940 microplate analyzer (Berthold Technologies). Cells were pre-incubated for 15 min in PBS in the presence of $2.5 \mu \mathrm{M}$ coelenterazine, following with light-emission acquisition at 485 and 530 nm done five times. The BRET signal was expressed in milliBRET units ( mBu ). The BRET unit has been defined previously as the ratio of emission $530 \mathrm{~nm} / 485 \mathrm{~nm}$ obtained when the two partners are present, corrected by the ratio 530 $\mathrm{nm} / 485 \mathrm{~nm}$ obtained under the same experimental conditions, when only the partner fused to Renilla luciferase was present in the assay.

Cell viability and toxicity evaluation.
Cells were seeded in 96 -well plates at a density of $5 \times 10^{3}$ cells per well. After 24 h , cells were treated with increasing doses of HDACi for 72 h . Toxicity and viability were sequentially determined. Cell toxicity was measured using CellTox ${ }^{\mathrm{TM}}$ Green Cytotoxicity Assay (Promega) (measure of cell permeability), followed by cell viability evaluated using CellTiter-Glo® Luminescent Cell Viability Assay (measure of ATP).

RNA isolation and measure of gene expression
Cells were seeded in 6 -well plates at a density of $2 \times 10^{5}$ cells per well. After 24 h , cells were treated with HDACi for 24 h . Total RNA was isolated using the Nucleospin ${ }^{\circledR}$ RNAII Kit according to the manufacturer's protocol (Macherey-Nagel). One microgram of total RNA was reverse-transcribed using Moloney murine leukemia virus reverse transcriptase (Invitrogen). Real-time PCR (qPCR) was carried out using an Mx3500P thermocycler (Stratagene). PCR reactions were performed using QuantiTect Primer Assays (Qiagen) and the RT $^{2}$ Real- Time SYBR-Green/ROX PCR Mastermix (Qiagen), according to the manufacturer's instructions. The relative amount of the target RNA, called the starting quantity (SQ), was determined using the Mx4000 software, by comparison with the corresponding standard curve for each sample performed in duplicate. Each transcript level was normalized by division with the expression values of the acidic ribosomal phosphoprotein P0 housekeeping gene ( $R P L P 0$ ), used as an internal standard.

Western blot analysis
Cells were seeded in 6 -well plates at a density of $2 \times 10^{5}$ cells per well. After 24 h , cells were treated with HDACi for 6 h or 20 h . Cells were washed with cold PBS and lysed with ice-cold RIPA buffer (SigmaAldrich) supplemented with protease inhibitor cocktail (Sigma-Aldrich). Cell lysates were transferred into 1.5 ml tubes. DNA was fragmented using sonication. After centrifugation at $13,000 \mathrm{~g}$ for 5 min at $4{ }^{\circ} \mathrm{C}$, supernatant protein levels were determined using BCA kit according to the manufacturer's recommendations. $10 \mu \mathrm{~g}$ from each sample were electrophoresed through a 4-20 \% polyacrylamide-SDS gel and transferred onto nitrocellulose membrane (Millipore). After blocking in PBS containing 0.2\% Tween 20 (Sigma-Aldrich) (PBS-T) and 3\% (w/v) bovine serum albumin (BSA) for 1 h at room temperature (RT), the membrane was incubated overnight at $4^{\circ} \mathrm{C}$ with primary antibody diluted in blocking buffer. The membrane was washed three times with PBS-T and incubated for 1 h with secondary antibody conjugated to fluorophore diluted $1 / 1000$ in blocking buffer. After three washes with PBS-T, analysis of the membrane was performed using a ChemiDoc ${ }^{\text {TM }}$ MP Imaging System (Bio-Rad).

## Molecular Docking

Crystal structures of HDAC isoforms (downloaded from Protein Data Bank: HDAC1 - 5ICN, HDAC2 4LXZ, HDAC3 - 4A69, HDAC4 - 4CBY, first catalytic domain of HDAC6-5G0G, second catalytic domain of HDAC6 - 5EDU, HDAC7 - 3ZNR, HDAC8 - 1T64 ) and homology models of three HDAC isoforms (HDAC5, HDAC9 and HDAC11) from Professor Olaf Wiest group (http://www3.nd.edu/~owiest/) were used for virtual docking study of ( $S$ )-TSA and synthetized compound 18.

Docking studies were performed with GOLD software 5.6.0, using ChemScore as the scoring function. The protein structures were prepared with PlayMolecule web server (https://playmolecule.org/). The binding cavity for ( $S$ )-TSA and $\mathbf{1 8}$ was set around $\mathrm{Zn}^{2+}$ ion in area within $15 \AA$. All torsion angles in TSA and compound $\mathbf{1 8}$ were allowed to rotate freely. The water molecules from the crystal structures were left in the active pocket to toggle and spin in order to examine their importance during ligand-protein recognition. For each ligand 30 docking runs were performed and tested several different docking setups in order to find the best concordance with the crystal structure of inhibitor (HDAC1, HDAC2, HDAC3, HDAC4, HDAC6, HDAC7, HDAC8 and HDAC10) complexes. The validity of homology and crystal structure models were confirmed by comparing experimentally observed binding modes of HDAC inhibitors and re-docked binding modes of the same inhibitors (calculation of RMSD values). We performed the geometrical optimization with (S)-TSA and compound $\mathbf{1 8}$ (Hartree-Fock method, 3-21 G basis set).
