## 5. Computed B.D.E of Cyclopropane Ring C-C $\sigma$-Bond

The bond dissociation energy (B.D.E) of ring $\mathrm{C}-\mathrm{C} \sigma$-bonds in cyclopropanes is estimated based on the method employed by Jones. ${ }^{1} \Delta \mathrm{H}_{\mathrm{f}}{ }^{\mathrm{o}}$ calculated with HF/6-31G*/T1 method using Spartan 2018.

## 6. Experimental Section

## General Procedures

Unless otherwise noted, all reagents were purchased from commercial suppliers and directly used without further purification. Hexane for chromatography was distilled from anhydrous calcium chloride. Benzene was distilled over sodium under nitrogen. Thinlayer chromatography was performed on precoated silica gel $60 \mathrm{~F}_{254}$ plates. Silica gel (Merck, 70-230 and 230-400 mesh) was used in column chromatography to isolate. Neutral alumina (Merck, 90 active neutral, 70-230 mesh)/ $\mathrm{H}_{2} \mathrm{O}(\sim 10: 1 \mathrm{v} / \mathrm{v})$ was used in column chromatography to isolate. For the reaction conducted in a sealed NMR tube, the mixture was degassed by three freeze ( 77 K )-pump ( 0.005 mmg )-thaw cycles, and then flame-sealed under vacuum, heated in oven in dark and wrapped with alumina foil to protect from exposure to room light before ${ }^{1} \mathrm{H}$ NMR measurements. The NMR yields were calculated using benzene residue or excess ${ }^{i} \mathrm{PrOH}$ as internal standard. trans-1,2Diphenyl cyclopropane (trans-1f), ${ }^{3}$ trans-1-benzoyl-2-phenylcyclopropane (trans-1g), ${ }^{4}$ 2-phenyl-cyclopropanecarboxylic acid ethyl ester (1h), ${ }^{5}$ trans-2-phenylcyclopropanecarbonitrile (trans-1i), ${ }^{6}$ trans,cis-2,3-diphenyl-1-cyclopropanecarboxylic acid ethyl ester ( $\mathbf{1} \mathbf{j})^{7}$ and trans,trans-2,3-diphenyl-1-benzoylcyclopropane $(\mathbf{1 k})^{8}$ have been characterized and were prepared according to the literature process.
${ }^{1} \mathrm{H}$ NMR spectra was recorded on a Bruker AV-400 instrument at 400 MHz . Chemical shifts were referenced with the residual solvent protons in $\mathrm{CDCl}_{3}(\delta 7.26 \mathrm{ppm}), \mathrm{C}_{6} \mathrm{D}_{6}$ ( $\delta$ 7.15 ppm ). Chemical shifts $(\delta)$ are reported as parts per million ( ppm ) in $\delta$ scale downfield from TMS. Coupling constants ( $J$ ) are reported in Hertz (Hz). High-resolution mass spectrometry (HRMS) was performed on Bruker Autoflex speed MALDI-TOF instrument using a trans-2-[3-(4-tert-butylphenyl)-2-methyl-2-propenylidene]malononitrile (DCTB) matrix and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as the solvent. GC-MS analyses were conducted on a GCMS-QP2010 Plus system using an Rtx-5MS column ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm}$ ). Details of the GC program are as follows. The column oven temperature and injection temperature were 100 and $250{ }^{\circ} \mathrm{C}$. Helium was used as the carrier gas. The flow control mode was chosen as linear velocity ( $36.3 \mathrm{~cm} \mathrm{~s}^{-1}$ ) with a pressure of 68.8 kPa . The total flow, column flow, and purge flow were $13.5,0.95$, and $3.0 \mathrm{~mL} \mathrm{~min}^{-1}$, respectively. Split
mode injection with a split ratio of 10.0 was applied. After injection, the column oven temperature was kept at $100{ }^{\circ} \mathrm{C}$ for 2 min and was then elevated at a rate of $30^{\circ} \mathrm{C} \mathrm{min}{ }^{-1}$ for 5 min until $250^{\circ} \mathrm{C}$. The temperature of $250^{\circ} \mathrm{C}$ was kept for 4 min . The retention time and mass spectrum of organic products obtained were identical with those of commercially available authentic samples.

## Preparation of Cyclopropane Substrates.

 trans-1,2-Diphenylcyclopropane (trans-1f) ${ }^{3}$

A solution of trifluoroacetic acid ( $620 \mu \mathrm{~L}, 8 \mathrm{mmol}$ ) in 2 mL dry dichloromethane was added very slowly at $0{ }^{\circ} \mathrm{C}$ to a solution of diethyl zinc ( 1.0 M in hexane, $8 \mathrm{~mL}, 8 \mathrm{mmol}$ ) in 4 mL dry dichloromethane under $\mathrm{N}_{2}$. The mixture was further stirred for 30 min to give solid attached on the side of flask. A solution of diiodomethane ( $700 \mu \mathrm{~L}, 8 \mathrm{mmol}$ ) in 2 mL dry DCM was added to the reaction mixture at $0^{\circ} \mathrm{C}$ over 30 min and further stirred for 30 min . A solution of trans-stilbene ( $365 \mathrm{mg}, 2 \mathrm{mmol}$ ) in 2 mL dry DCM was added to the reaction mixture at $0^{\circ} \mathrm{C}$ and was stirred at r.t. for 24 h . The reaction was quenched with sat. $\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{aq})(15 \mathrm{~mL})$ and extracted with $\mathrm{DCM}(3 \times 30 \mathrm{~mL})$. The organic layers were combined and washed with sat. $\mathrm{NaHCO}_{3}(\mathrm{aq})(2 \times 15 \mathrm{~mL})$, water $(15 \mathrm{~mL})$ and brine $(2 \times 15 \mathrm{~mL})$. The resulting organic layer was further dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated with rotary evaporator. The resulting yellow oil was dissolved in DCM ( 10 mL ). $m$ CPBA ( $350 \mathrm{mg}, 2 \mathrm{mmol}$ ) was added to the reaction mixture and the resulted mixture was stirred at r.t. overnight. The reaction was quenched with sat. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(\mathrm{aq})(20 \mathrm{~mL})$ and extracted with DCM $(2 \times 20 \mathrm{~mL})$. The organic layer was washed with sat. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(\mathrm{aq})(2 \times 20 \mathrm{~mL})$ and brine ( 20 mL ). The resulting organic layer was further dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated with rotary evaporator. The residue was purified with column chromatography on silica gel and using hexane as eluent to afford trans-1,2diphenylcyclopropane (trans-1f) as a colorless oil in $52 \%$ yield ( $202 \mathrm{mg}, 1.01 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 1.45\left(\mathrm{t},{ }^{3} J_{\mathrm{H}-\mathrm{H}}=7.2 \mathrm{~Hz}, 2 \mathrm{H}\right), 2.17\left(\mathrm{t},{ }^{3} J_{\mathrm{H}-\mathrm{H}}=7.4 \mathrm{~Hz}, 2 \mathrm{H}\right)$, 7.13-7.20 (m, 6 H), 7.27-7.31 (m, 4 H).

## trans-1-Benzoyl-2-phenylcyclopropane (trans-1g) ${ }^{4}$

Trimethylsulfoxonium iodide ( $893.6 \mathrm{mg}, 4.1 \mathrm{mmol}$ ) and $\mathrm{NaH}(492 \mathrm{mg}, 20.6 \mathrm{mmol})$ were added into a 25 mL two-necked round-bottom flask, refilled with $\mathrm{N}_{2}$ for 3 times. Dry DMF ( 4 mL ) was added to the flask through syringe. A solution of ( $E$ )-chalcone (765.3 $\mathrm{mg}, 3.7 \mathrm{mmol})$ in dry DMF ( 1 mL ) was added to the flask at $0^{\circ} \mathrm{C}$. The reaction mixture was warmed up to r.t. and stirred for 2 h , then further warmed up to $50^{\circ} \mathrm{C}$ and stirred for another 8 h . Water ( 10 mL ) was added to quench the reaction and $\mathrm{DCM}(10 \times 3 \mathrm{~mL})$ was used to extract the product for 3 times. The combined organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo. The crude product was purified by column chromatography on silica gel using EA/hexane (v/v: $2 \% \sim 5 \%$ ) as eluent to get the target product in $53 \%$ yield ( $429.1 \mathrm{mg}, 1.93 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 1.53-1.58$ (m, 1 H ), 1.90-1.95 (m, 1 H$), 2.67-2.72(\mathrm{~m}, 1 \mathrm{H}), 2.88-2.92(\mathrm{~m}, 1 \mathrm{H}), 7.17-7.33(\mathrm{~m}, 5 \mathrm{H})$, 7.44-7.58 (m, 3 H ), 7.98-8.00 (m, 2 H ). $\mathrm{Lit}^{9}$ IR (neat) 2980, 1711, 1627, 1272, $1164 \mathrm{~cm}^{-1}$.

## 2-Phenyl-cyclopropanecarboxylic acid ethyl ester (1h) ${ }^{5}$

Styrene ( $60 \mu \mathrm{~L}, 0.52 \mathrm{mmol}$ ), ethyl diazoacetate ( $66 \mu \mathrm{~L}, 0.63 \mathrm{mmol}$ ), Co(tap) ( 8.0 mg , 0.010 mmol ) and 2 mL benzene were added into a Teflon crew capped reaction tube. The mixture was degassed by three freeze-pump-thaw cycles and heated to $80^{\circ} \mathrm{C}$ for 8 h . Trimethylsulfoxonium iodide ( $920.0 \mathrm{mg}, 4.2 \mathrm{mmol}$ ) and $\mathrm{NaH}(480 \mathrm{mg}, 20.0 \mathrm{mmol})$ were added in to a 25 mL two-necked round-bottom flask, refilled with $\mathrm{N}_{2}$ for 3 times. Dry DMF ( 4 mL ) was added to the flask through syringe. A solution of $(E)$-cinnamonitrile $(480 \mu \mathrm{~L}, 3.8 \mathrm{mmol})$ in dry DMF ( 1 mL ) was added to the flask at $0^{\circ} \mathrm{C}$. The reaction mixture was warmed up to r.t. and stirred for 19 h , then further warmed up to $50^{\circ} \mathrm{C}$ for another 8 h . Water was added to quench the reaction and DCM ( $10 \times 3 \mathrm{~mL}$ ) was used to extract the product for 3 times. The combined organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo. The crude product was purified by column chromatography on silica gel using EA/hexane (v/v: $2 \% \sim 4 \%$ ) as eluent to get the target product in $5 \%$ yield ( $28.3 \mathrm{mg}, 0.2 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 1.43-1.48(\mathrm{~m}, 1$ H), 1.53-1.58 (m, 1 H), 1.60-1.64 (m, 1 H), 2.61-2.66 (m, 1 H$), 7.09-7.33(\mathrm{~m}, 5 \mathrm{H})$.

## 10. X-ray Data

X-ray Crystallographic Data and Structure of $\mathrm{Rh}(\mathrm{ttp}) \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Ph} \cdot \mathrm{PhCH}_{3}$. Data were collected on a Bruker D8Venture diffractometer with a Mo K $\alpha$ microfocus source ( $\lambda=$ $0.71073 \AA$ ) at 299 K , using phi scan mode with an increment of $0.5^{\circ}$. Unit cell parameters were obtained from 60 frames. The collected frames were integrated with the unit cell
parameters. Apex2 software was used for collecting frames of data, indexing reflections and determination of lattice constants; integration of intensity of reflections and scaling; and SHELXL for space group and structure determination, refinements, graphics, and structure reporting.
