Figure S34. Relation between the experimental maximum volume degree of swelling (q_{\max}) of W₂-PDCPD xerogels and the Hansen Solubility Parameters (HSP): total solubility parameter (δ_T , a), D-component (δ_D , b), P-component (δ_P , c) and H-component (δ_H , d) of the respective solvents.	25
Figure S35. 3D plot of the individual Hansen Solubility Parameters (HSP) for each solvent tested. Blue dots represent solvents in which W₂-PDCPD xerogels swelled (23 “good” solvents – score: “1”). Red squares represent solvents in which no swelling was observed (21 “bad” solvents – score: “0”). The green sphere, generated by the HSPiP 5.1.02 software, is the sphere with the minimum diameter that fits best the experimental data. The center of the sphere is a reasonable estimate of the HSP of W₂-PDCPD , which is represented by the green dot. The sphere contains all “good” solvents and no “bad” solvents (referred to as wrong solvents), giving a fit value of 1.0, which is considered as a perfect fit.	28
Figure S36. 2D projections, generated by the HSPiP 5.1.02 software, of the individual Hansen Solubility Parameters (HSP) for each solvent tested at the three planes of the cube inscribing the sphere of Figure S35, as indicated. Blue dots represent solvents in which W₂-PDCPD xerogels swelled (“good” solvents). Red squares represent solvents in which no swelling was observed (“bad” solvents). The green dot represents W₂-PDCPD itself. The green circle contains all “good” solvents.	28
Figure S37. 2D projections, generated by the HSPiP 5.1.02 software, of the individual Hansen Solubility Parameters (HSP) for each solvent tested at the three planes of the cube inscribing the	

sphere of Figure 5 of the manuscript, as indicated. Blue dots represent solvents in which **W₂-PDCPD** xerogels swelled (“good” solvents). Red squares represent solvents in which no swelling was observed (“bad” solvents). The green dot represents **W₂-PDCPD** itself. The green circle contains all “good” solvents. 29

Comparison of solvent uptake of W₂-PDCPD xerogels with polymeric materials from the literature

By comparison to other organic polymers on per weight basis, **W₂-PDCPD** xerogels showed higher solvent uptake for toluene and CHCl₃ in several cases. Specifically, they outperformed: (a) photoresponsive copolymers derived from isodecyl acrylate, lauryl acrylate, *tert*-butylstyrene and 4-(methacrylamino)azobenzene ($\sim 7\times$ higher for toluene and $\sim 4\times$ higher for CHCl₃);¹ (b) copolymers of cinnamoyloxy ethyl methacrylate and octadecyl acrylate ($\sim 3\times$ higher for toluene);² (c) disulfide-linked polymeric networks based on trimethylolpropane tris(3-mercaptopropionate), or on pentaerythritol tetrakis(3-mercaptopropionate) (more than $80\times$ higher for CHCl₃ and $\sim 6\times$ higher for CH₂Cl₂);³ (d) mesogenic polyelectrolyte gels ($\sim 13\times$ higher for CHCl₃);⁴ (e) conjugated microporous (co)polymers synthesized from 1,3,5-triethynylbenzene or 1,3,5-triethynylbenzene and 1,4-diethynylbenzene ($\sim 5\times$ higher for CHCl₃);⁵ (f) polymethylsilsesquioxanes (appr. $6\times$ higher for CHCl₃);⁶ (g) porous polyurea monoliths derived from toluene diisocyanate ($\sim 11\times$ higher for toluene, $\sim 6\times$ higher for CHCl₃);⁷ (h) *cis*-9-octadecenyl-based polymers ($\sim 30\times$ higher for toluene, $\sim 10\times$ higher for CHCl₃, $\sim 2\times$ higher for THF, $\sim 2.5\times$ higher for CH₂Cl₂, $\sim 3\times$ higher for benzene);⁸ and (i) poly(alkoxysilanes) (more than $11\times$ higher for toluene, $\sim 1.5\times$ higher for benzene, almost equal for THF and CH₂Cl₂).⁹ On the other hand, solvent uptake was equal to or lower than what was reported for the photoresponsive polymer mentioned above (almost equal for CH₂Cl₂),¹ nanoporous polydivinylbenzene (almost equal for benzene),¹⁰ mesogenic polyelectrolyte gels ($\sim 4\times$ lower for THF and $\sim 7\times$ lower for CH₂Cl₂),⁴ and melamine formaldehyde sponges ($\sim 2\times$ lower for CHCl₃).¹¹ The last three materials as well as polymethylsilsesquioxanes could also absorb solvents that **W₂-PDCPD** did not absorb (e.g., DMF, DMSO, ketones, alcohols, alkanes).^{4,6,11} Compared to crosslinked lipophilic polyelectrolytes, **W₂-PDCPD** showed higher uptake of toluene ($\sim 7\times$), almost equal uptake of CHCl₃, and lower uptakes of chlorobenzene ($\sim 2\times$), THF ($\sim 8\times$), CH₂Cl₂ ($\sim 8\times$), dichloroethane ($\sim 65\times$), while those materials could also absorb several solvents that could not be absorbed by **W₂-PDCPD** xerogels, mainly alcohols and ketones, signifying the superiority of the latter in terms of selectivity.¹²

Table S1. Solvent uptake and density of **W₂-PDCPD** xerogels and other materials from the literature, for comparison purposes.

^a Experimental maximum volume degree of swelling of **W2-PDCPD** gels at t_{\max} (mean values of at least three measurements), calculated according to the equation $q_{\max} = V_{\max}/V_{\text{in}}$, where V_{\max} is the volume of the wet-gel at t_{\max} and V_{in} is the initial volume of the xerogel. ^b Surface tension (γ) calculated from Beerbower's equation: $\gamma = 0.01709 V_m^{1/3} [\delta_D^2 + 0.632(\delta_P^2 + \delta_H^2)]$. ^c Beerbower's equation is not valid for aliphatic alcohols.

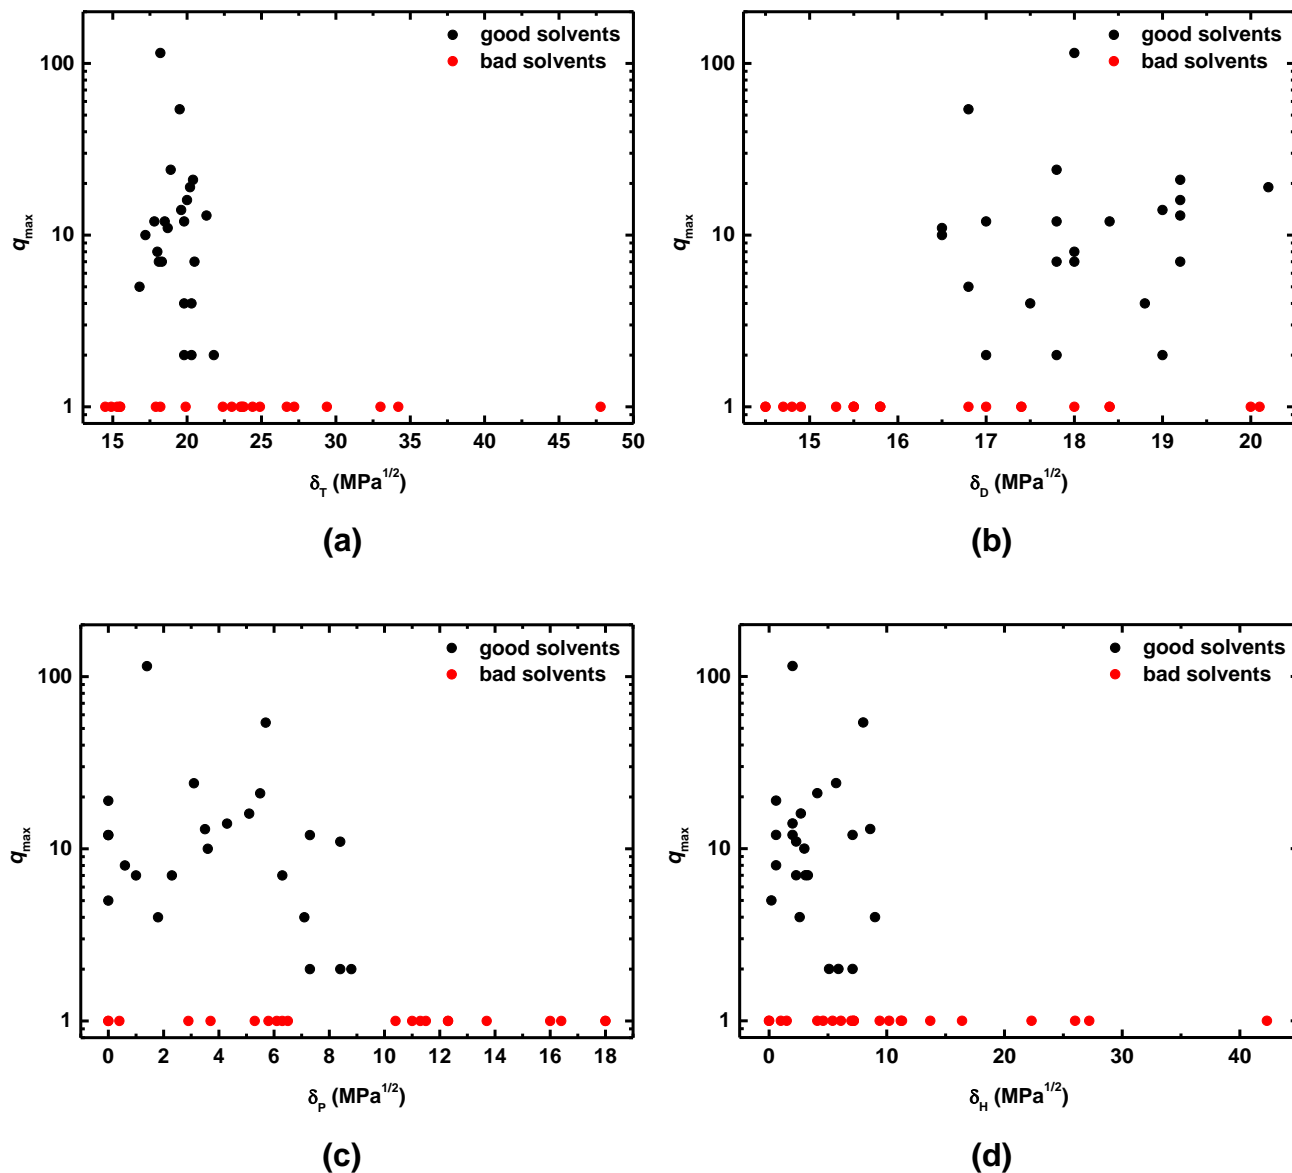

Figure S34. Relation between the experimental maximum volume degree of swelling (q_{\max}) of **W₂-PDCPD** xerogels and the Hansen Solubility Parameters (HSP): total solubility parameter (δ_T , a), D-component (δ_D , b), P-component (δ_P , c) and H-component (δ_H , d) of the respective solvents.

1st Method of HSPiP: Inside-Out Solvents

Table S3 shows the HSP of all solvents used in this study, their empirical classification as score “1” solvents (gels swelled) or score “0” solvents (gels did not swell) and the corresponding RED (Relative Energy Difference) values. RED values were calculated using the formula: $RED = (\text{distance of solvent from the center of the sphere}) / (\text{radius of the sphere})$. RED values close to 0 indicate higher, and RED values close to 1 indicate lower affinity of the solvent with the molecule under study (located at the center of the sphere).

Figure S35 shows the generated sphere ($R = 5.9$) and the HSP (in $\text{MPa}^{1/2}$) for **W₂-PDCPD**: $\delta_D = 18.15$, $\delta_P = 3.69$, $\delta_H = 3.55 \text{ MPa}^{1/2}$, and $\delta_T = 18.86 \text{ MPa}^{1/2}$. The 2D plots (Figure S36) display the boundaries in HSP space and help visualize whether the solvents tested cover sufficiently the entire range of each solubility parameter (δ_P , δ_D , and δ_H). It is obvious that solvents covering the entire range of the three HSPs have been used.

Table S3. Experimental maximum volume degree of swelling (q_{\max}) of **W₂-PDCPD** xerogels in various solvents, Hansen Solubility Parameters (HSP) of the solvents,²⁴ scoring according to whether they are “good” (“1”) or “bad” (“0”) solvents, and calculated Relative Energy Differences (RED).

^a Experimental maximum volume degree of swelling of **W₂-PDCPD** gels at t_{\max} (mean values of at least three measurements), calculated according to the equation $q_{\max} = V_{\max}/V_{\text{in}}$, where V_{\max} is the volume of the wet-gel at t_{\max} and V_{in} is the initial volume of the xerogel. ^b Values calculated by the HSPiP 5.1.02 software.

Figure S35. 3D plot of the individual Hansen Solubility Parameters (HSP) for each solvent tested. Blue dots represent solvents in which **W₂-PDCPD** xerogels swelled (23 “good” solvents – score: “1”). Red squares represent solvents in which no swelling was observed (21 “bad” solvents – score: “0”). The green sphere, generated by the HSPiP 5.1.02 software, is the sphere with the minimum diameter that fits best the experimental data. The center of the sphere is a reasonable estimate of the HSP of **W₂-PDCPD**, which is represented by the green dot. The sphere contains all “good” solvents and no “bad” solvents (referred to as wrong solvents), giving a fit value of 1.0, which is considered as a perfect fit.

Figure S36. 2D projections, generated by the HSPiP 5.1.02 software, of the individual Hansen Solubility Parameters (HSP) for each solvent tested at the three planes of the cube inscribing the sphere of Figure S35, as indicated. Blue dots represent solvents in which **W₂-PDCPD** xerogels swelled (“good” solvents). Red squares represent solvents in which no swelling was observed (“bad” solvents). The green dot represents **W₂-PDCPD** itself. The green circle contains all “good” solvents.

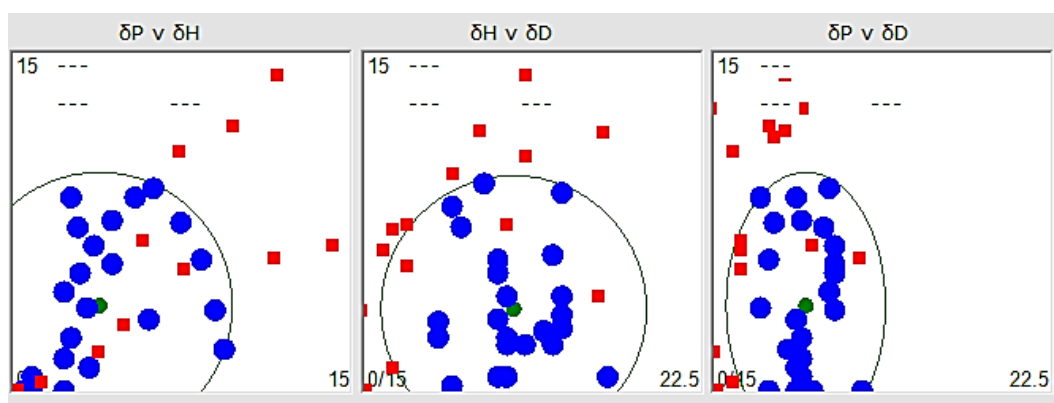

Figure S37. 2D projections, generated by the HSPiP 5.1.02 software, of the individual Hansen Solubility Parameters (HSP) for each solvent tested at the three planes of the cube inscribing the sphere of Figure 5 of the manuscript, as indicated. Blue dots represent solvents in which **W₂-PDCPD** xerogels swelled (“good” solvents). Red squares represent solvents in which no swelling was observed (“bad” solvents). The green dot represents **W₂-PDCPD** itself. The green circle contains all “good” solvents.

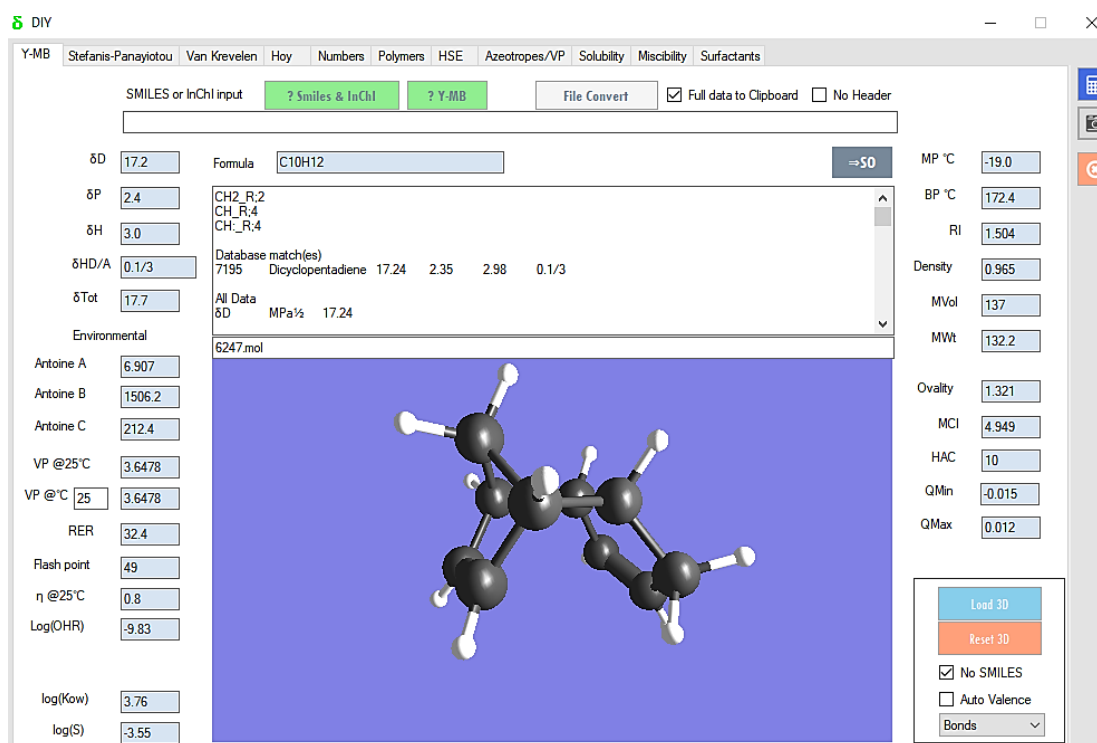

Figure S38. Calculation of the Hansen Solubility Parameters (HSP) of dicyclopentadiene (DCPD) using the DIY method of the HSPiP 5.1.02 software.

Figure S39. Same as Figure 5 of the manuscript, showing also the location of dicyclopentadiene (DCPD; orange dot; RED = 0.438).

Table S4. Calculated Hansen Solubility Parameters (HSP) of **W₂-PDCPD** xerogels and solvents.

Solvent	$\Delta 2\delta_D^a$ (MPa ^{1/2})	$\Delta\delta_P^b$ (MPa ^{1/2})	$\Delta\delta_H^c$ (MPa ^{1/2})
toluene	0.3	2.3	1.6
chloroform	0.7	0.6	-2.2
bromobenzene	-2.1	-1.8	-0.6
carbon disulfide	-4.1	3.7	3.7
1,3-dichlorobenzene	-2.1	-1.4	0.9
carbon tetrachloride	0.7	3.7	3.0
chlorobenzene	-1.7	-0.6	1.6
1,2-dibromoethane	-2.1	0.2	-5.1
tetrahydrofuran	2.7	-2.0	-4.5
benzene	-0.5	3.7	1.6
ethyl bromide	3.3	-4.7	1.3
1-bromobutane	3.3	0.1	0.6
methylene dichloride	2.3	-3.6	-3.6
1,3,5-trimethylbenzene	0.3	3.1	3.0
1,4-dimethylbenzene	0.7	2.7	0.5
1,3-dimethylbenzene	0.3	1.4	1.3
1,2-dichlorobenzene	-2.1	-2.6	0.3
benzyl chloride	-1.3	-3.4	1.0
cyclohexane	2.7	3.7	3.4
1,4-dioxane	1.3	1.9	-5.5
cyclohexanone	0.7	-4.7	-1.6
1,2-dichloroethane	2.3	-3.6	-3.6
pyridine	-1.7	-5.1	-2.4
water	5.3	-12.3	-38.8
pentane	7.3	3.7	3.6
<i>N,N</i> -dimethylformamide	1.5	-10.0	-7.8
methanol	6.9	-8.6	-18.8
dimethylsulfoxide	-0.5	-12.7	-6.7
diethyl ether	7.3	0.8	-1.1
acetonitrile	5.7	-14.3	-2.6
acetone	5.3	-6.7	-3.5
hexane	6.5	3.7	3.6
2-propanol	4.7	-2.4	-12.9
glycerol	1.5	-7.6	-23.7
ethylene glycol	2.3	-7.3	-22.5
benzyl alcohol	-0.5	-2.6	-10.2
<i>N,N</i> -dimethylacetamide	2.7	-7.8	-5.9
methyl-2-pyrrolidone	0.3	-8.6	-3.7
triethylamine	5.3	3.3	2.6
diisopropylamine	6.7	0.0	2.1
aniline	-3.9	-2.1	-7.7
methyl methacrylate	4.7	-2.8	-1.9
propylene carbonate	-3.7	-14.3	-0.6
ethyl acetate	4.7	-1.6	-3.7

^a $\Delta 2\delta_D = (2\delta_{D1}) - (2\delta_{D2})$. ^b $(\Delta\delta_P) = (\delta_{P1}) - (\delta_{P2})$. ^c $(\Delta\delta_H) = (\delta_{H1}) - (\delta_{H2})$. “1” refers to **W₂-PDCPD** xerogels and “2” refers to the solvent. Hansen Solubility Parameters (HSP) for **W₂-PDCPD**: $\delta_D = 18.15$, $\delta_P = 3.69$, $\delta_H = 3.55$ MPa^{1/2}.

(a)

(b)

Figure S40. 2D plots of the magnitude differences between the solvent and **W₂-PDCPD** xerogels: $\Delta\delta_P$ vs $\Delta 2\delta_D$ (a) and $\Delta\delta_H$ vs $\Delta 2\delta_D$ (b). Green dot shows point (0,0).
