Supporting Information

## 1 Comparison of density of the glucose solution in ABW and SCW

Figure S1: Density of acidified glucose solution in ABW (black curve) and SCW (red curve) plotted against time.

## 2 Metadynamics parameters

Table S1: Mass of the collective variables ( $m$ ) and coupling constants ( $k$ ) used in the extended Lagrangian metadynamics simulations

| Collective Coordinate | Label | $m$ (a.m.u.) | $k$ (a.u.) |
| :---: | :---: | :---: | :---: |
| Distance | $d$ | 50.0 | 2.0 |
| Distance Difference | $\Delta d$ | 50.0 | 0.5 |
| Coordination Number | $C$ | 50.0 | 2.0 |
| Coordination Number Difference | $\Delta C$ | 50.0 | 2.0 |
| Dihedral | $\phi$ | 50.0 | 0.8 |

Here, coordination number between atom types A and B is defined as,

$$
\begin{equation*}
C=\sum_{I \in \mathrm{~A}} \sum_{J \in \mathrm{~B}} \frac{1}{1+\left(d_{I J} / d_{\mathrm{AB}}^{0}\right)^{6}} \tag{S1}
\end{equation*}
$$

where $d_{I J}$ is the internuclear distance between atom $I$ and $J$ at any point of time, and $d_{\mathrm{AB}}^{0}$ is the bond distance cut-off parameter. $d_{\mathrm{AB}}^{0}$ values used in this study between different atom types are given in Table S2.

Table S2: Values of $d^{0}$ parameter in Equation (S1) used for different types of atoms during the metadynamics simulation with coordination number collective coordinate

| Collective coordinate | $d^{0}(\AA)$ |
| :---: | :---: |
| $C[\mathrm{C}-\mathrm{H}]$ | 1.4 |
| $C\left[\mathrm{C}-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | 1.3 |
| $C[\mathrm{O}-\mathrm{H}]$ | 1.3 |
| $C\left[\mathrm{C}-\mathrm{O}_{\mathrm{w}}\right]$ | 1.8 |
| $C\left[\mathrm{C}-\mathrm{O}_{\mathrm{OH}}\right]$ | 2.0 |

## 3 List of Collective Variables Used

Table S3: CCs used for modeling various reactions

| Reaction | CC | Description | CV Label |
| :---: | :---: | :---: | :---: |
| $\mathrm{G} \rightarrow \mathrm{F} 1$ | $C[\mathrm{C} 2-\mathrm{O} 2]$ | Coordination number between C2 and O2 | CV1 |
|  | $C[\mathrm{O} 5-\mathrm{C} 2]$ | Coordination number between O5 and C2 | CV2 |
|  | $C\left[\mathrm{O} 2-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 2 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV3 |
| F1 $\rightarrow$ G/G1 | $\Delta d[\mathrm{O} 5-\mathrm{C} 1-\mathrm{O} 1]$ | Distance (in $\AA$ ) Difference between O5-C1 and C1-O1 | CV4 |
|  | $C[\mathrm{O} 5-\mathrm{C} 2]$ | Coordination number between O5 and C2 | CV5 |
|  | $C\left[\mathrm{C} 2-\mathrm{O}_{\mathrm{w}}\right]$ | Coordination number between C 2 and all the oxygens of water | CV6 |
| $\mathrm{G} 1 \rightarrow \mathrm{G}^{1}$ | $\phi[\mathrm{C} 3-\mathrm{C} 2-\mathrm{C} 1-\mathrm{O} 5]$ | Dihedral (in degrees) between atoms C3, C2, C1 and O5 | CV52 |
| F1/F1b $\rightarrow$ F2 | $C[\mathrm{C} 2-\mathrm{H} 2]$ | Coordination number between C2 and H | CV16 |
|  | $C\left[\mathrm{O} 1-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 1 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV17 |
| F2 $\rightarrow$ F1 | $d[\mathrm{C} 1-\mathrm{C} 2]$ | Distance (in $\AA$ ) between C1 and C2 | CV18 |
|  | $C\left[\mathrm{C} 2-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between C 2 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV19 |
|  | $C\left[\mathrm{O} 1-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 1 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV20 |
| F2 $\rightarrow$ F3 | $C[\mathrm{C} 3-\mathrm{O} 3]$ | Coordination number between C3 and O3 | CV21 |

[^0]|  | $C\left[\mathrm{O} 3-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O3 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV22 |
| :---: | :---: | :---: | :---: |
|  | $C\left[\mathrm{O} 1-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 1 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV23 |
| F3 $\rightarrow$ F2 | $d[\mathrm{C} 2-\mathrm{C} 3]$ | Distance (in $\AA$ ) between C2 and C3 | CV24 |
|  | $C\left[\mathrm{O} 1-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O1 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV25 |
|  | $C\left[\mathrm{C} 3-\mathrm{O}_{\mathrm{w}}\right]$ | Coordination number between C 3 and oxygen of all $\mathrm{H}_{2} \mathrm{O}$ molecules | CV26 |
| F3 $\rightarrow$ H | $C[\mathrm{C} 5-\mathrm{H} 5]$ | Coordination number between C5 and H5 | CV27 |
|  | $C[\mathrm{C} 4-\mathrm{O} 4]$ | Coordination number between C4 and O4 | CV28 |
|  | $C\left[\mathrm{O} 4-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 4 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV29 |
| H $\rightarrow$ F3 | $d[\mathrm{C} 4-\mathrm{C} 5]$ | Distance (in $\AA$ ) between C4 and C5 | CV30 |
|  | $C\left[\mathrm{C} 5-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between C 5 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV31 |
|  | $C\left[\mathrm{C} 4-\mathrm{O}_{\mathrm{w}}\right]$ | Coordination number between C 4 and oxygen of all $\mathrm{H}_{2} \mathrm{O}$ molecules | CV32 |
| G $\rightarrow$ G3 | $\Phi[\mathrm{C} 3-\mathrm{C} 2-\mathrm{C} 1-\mathrm{O} 5]$ | Dihedral angle (in degrees) between atoms C3, C2, C1 and O5 | CV7 |
|  | $\Delta C[\mathrm{O} 2-\mathrm{C} 1, \mathrm{C} 1-\mathrm{O} 1]$ | Difference in coordination number between $\mathrm{O} 2-\mathrm{C} 1$ and $\mathrm{C} 1-\mathrm{O} 2$ | CV8 |

|  | $C\left[\mathrm{O} 1-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 1 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV9 |
| :---: | :---: | :---: | :---: |
| G3 $\rightarrow$ G1 | $C[\mathrm{C} 1-\mathrm{O} 2]$ | coordination number between C1 and O2 | CV10 |
|  | $C\left[\mathrm{C} 1-\mathrm{O}_{\mathrm{w}}\right]$ | Coordination number between C1 and all the oxygens of water | CV11 |
|  | $C\left[\mathrm{O} 1-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 1 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV12 |
| G3 $\rightarrow$ F1 | $C[\mathrm{O} 5-\mathrm{C} 2]$ | coordination number between O5 and C2 | CV13 |
|  | $C[\mathrm{C} 2-\mathrm{O} 2]$ | Coordination number between C2 and O2 | CV14 |
|  | $C\left[\mathrm{O} 2-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 2 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV15 |
| G $\rightarrow$ R1 | $d[\mathrm{C} 1-\mathrm{O} 5]$ | Distance (in A) between atoms C1 and O5 | CV33 |
|  | $C\left[\mathrm{O} 1-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 1 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV34 |
|  | $C\left[\mathrm{O} 5-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 5 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV35 |
| R1 $\rightarrow$ G1 | $C\left[\mathrm{O} 1-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 1 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV36 |
|  | $d[\mathrm{C} 1-\mathrm{O} 5]$ | Distance (in $\AA$ ) between C1 and O5 | CV37 |
|  | $C\left[\mathrm{O} 5-\mathrm{H}_{\mathrm{w}, \mathrm{OH}}\right]$ | Coordination number between O 5 and all the hydrogens of $\mathrm{H}_{2} \mathrm{O}$ and hydroxyl groups | CV38 |

| R1 $\rightarrow$ R3 | $\Delta d[\mathrm{C} 2-\mathrm{H} 2-\mathrm{C} 1]$ | Difference between  <br> distances (in $\AA)$ <br> $d[\mathrm{C} 2-\mathrm{H} 2]$  and <br> $d[\mathrm{H} 2-\mathrm{C} 1]$   <br>    | CV39 |

## 5 Effect of intra-molecular hydrogen bond interactions

Analysis of elementary reactions along all the pathways indicates that intra-molecular hydrogen bond interactions can act as both facilitators and retardant depending on the nature of the reaction. For example, during $\mathbf{F} \rightarrow \mathbf{R} 3$ and $\mathbf{F} 2 \rightarrow \mathbf{F} 3$ these interactions result in an increase in free energy barrier whereas for $\mathbf{F} \mathbf{2} \rightarrow \mathbf{F} 1$ they have the opposite effect. Formation of $\mathbf{R} 3$ from $\mathbf{F}$ (see Figure 5) involves the cleavage of O5-C2 bond after the protonation of O5 by bulk water molecules. It was found that the free energy barrier for this reaction in SCW is about $6 \mathrm{kcal} \mathrm{mol}^{-1}$ higher than that in ABW. Metadynamics simulations indicate the presence of stable intra-molecular interactions between O5 of F1 and the hydrogens (H6a and H1a) of neighboring $-\mathrm{CH}_{2} \mathrm{OH}$ groups in SCW, whereas number of such interactions are found to be lesser in ABW than that in SCW (Figure S52 (c), (d)), especially the strong hydrogen bond interactions (Figure S52 (a), (b)). Since protonation at O5 by bulk water assists the O5-C2 bond cleavage, the intra-molecular interactions between O 5 and hydrogens (H6a and H1a) which reduce accessibility of bulk water by interacting with the lone pairs of O5 is expected to slow down the reaction in SCW. It was also noted that near to the TS, number of such intra-molecular interactions were found to be decreasing. Therefore, the higher free energy barrier for $\mathbf{F} \rightarrow \mathbf{R} \mathbf{3}$ in SCW compared to ABW can be ascribed to the

Figure S52: (a),(b) Number of intra-molecular hydrogen bond interactions (black curve and left Y-axis) and distance (in $\AA$ ) between atoms O 5 and $\mathrm{C} 2, d[\mathrm{O} 5-\mathrm{C} 2]$ (blue curve and right Y-axis) as a function of metadynamics time in ABW and SCW, respectively. The approximate transition region is highlighted by red rectangles. Cumulative sum of number of intra-molecular hydrogen bonding interaction as a function of distance (in $\AA$ ) between O 5 and (c) H1a (hydrogen of O1), $d[\mathrm{O} 1-\mathrm{H} \cdots \mathrm{O} 5]$ and (d) $\mathrm{H} 6 \mathrm{a}, d[\mathrm{O} 6-\mathrm{H} \cdots \mathrm{O} 5]$ in ABW (black curve) and in SCW (red curve) for step $\mathbf{F} \rightarrow \mathbf{R} 3$. Here, intra-molecular interactions are counted after neglecting the angle cut-off used to determine hydrogen bonding shown in Figure 10 of the manuscript.

Figure S53: Distance ( $\AA$ ) between H3a (hydrogen of O3) and O6, $d[\mathrm{O} 3-\mathrm{H} \cdots \mathrm{O} 6]$ (black curve and left Y-axis) and distance ( $\AA$ ) between C3 and O3, $d[\mathrm{C} 3-\mathrm{O} 3]$ (blue curve and right Y-axis) as a function of metadynamics time for step $\mathbf{F} 2 \rightarrow \mathbf{F} 3$ in (a) ABW and (b) SCW.
stabilization of $\mathbf{F}$ and to the diminished affinity of O5 to get protonated.
Step $\mathbf{F} 2 \rightarrow \mathbf{F} 3$ is the acid catalyzed dehydration at C3. It was found that in SCW the free energy barrier for this reaction is about $7 \mathrm{kcal} \mathrm{mol}^{-1}$ higher than that in ABW (21 and $14 \mathrm{kcal} \mathrm{mol}^{-1}$, respectively). Our analysis indicated the presence of intra-molecular interactions between O6 and H3a (hydrogen of the hydroxyl group at C3) in SCW which is absent in ABW (Figure S53). The intra-molecular interactions between O3 and H6a in SCW hinder the protonation of O3 by bulk water molecules, which in turn prevent the dehydration at C3. These interactions are expected to slow down the reaction in SCW. Also, these interactions can stabilize the reactant state. Since these interactions are absent in the TS, in addition to the fact that the dehydration is slowed down due to intra-molecular interactions, the stabilization of reactant is also responsible for the higher free energy barrier

Figure S54: (a) Distance between H6a and O5 ( $d[\mathrm{O} 6-\mathrm{H} \cdots \mathrm{O} 5]$ ) as a function of metadynamics time under ABW (black curve and left Y-axis) and SCW (red curve and axis labels) for step $\mathbf{F} \mathbf{2} \rightarrow \mathbf{F}$ 1. The magenta circle indicates the region where intra-molecular interaction becomes prominent in SCW (b) $d[\mathrm{O} 6-\mathrm{H} \cdots \mathrm{O} 5]$ (blue curve and right Y-axis) and distance between C 2 and bulk water hydrogen $\left(\mathrm{H}_{\mathrm{w}}\right), d\left[\mathrm{C} 2-\mathrm{H}_{\mathrm{w}}\right]$ (black curve and left Y-axis) for reaction in SCW (c) $d\left[\mathrm{C} 2-\mathrm{H}_{\mathrm{w}}\right]$ (red curve and right Y -axis) and change in $\mathrm{O} 5-\mathrm{C} 2$ distance, $d[\mathrm{C} 2-\mathrm{O} 5]$, (violet curve and left Y-axis) as a function of metadynamics time for reaction in SCW. All the distances are in $\AA$.
in SCW compared to that in ABW. Similar observations are also found in other elementary steps such as $\mathbf{G} \mathbf{3} \rightarrow \mathbf{G}$ and $\mathbf{F} \mathbf{1} / \mathbf{F} \mathbf{1 b} \rightarrow \mathbf{F} \mathbf{2}$ and $\mathbf{H} \rightarrow \mathbf{F} 3$, where the free energy barrier in SCW is higher than that in ABW.

In contrast to the previous examples, intra-molecular interactions were found to assist $\mathbf{F} 2 \rightarrow \mathbf{F} 1$ in SCW. Here, the tautomer F2 undergoes protonation at C2 to form $\mathbf{F} 1$ (see Figure 3). In this case, the lower free energy barrier for reactions in SCW can be ascribed to
the activation of the double bond between C 1 and C 2 by weakening $\mathrm{O} 5-\mathrm{C} 2$ bond due to the intra-molecular interactions between H6a and O5 (Figure S54), which are absent in ABW. It was also noted that for many reactions where the groups such as -CHO or -OH , protonation of which facilitates the reaction, are not involved in any intra-molecular interactions in SCW, free energy barriers are comparable in ABW and SCW. The comparable free energy barriers (20 and $21 \mathrm{kcal} \mathrm{mol}^{-1}$ in ABW and SCW, respectively) for $\mathbf{R} \mathbf{1} \rightarrow \mathbf{R 3}$, where the reaction is facilitated by the protonation of O 1 of R 1 which is not involved in any intramolecular interactions in SCW, is an example of this (Figure S55).

R1

Figure S55: (a) Intra-molecular hydrogen bonding like interaction involving O1 (black curve and left Y-axis) and distance (in $\AA$ ) between H 2 and $\mathrm{C} 1, d[\mathrm{C} 1-\mathrm{H} 2]$ (blue curve and right Y-axis) as a function of metadynamics time for step $\mathbf{R} \mathbf{1} \rightarrow \mathbf{R} \mathbf{3}$ in SCW.

## 6 Accuracy of PBE functional

In order to estimate the error due to PBE functional, ${ }^{1}$ we have computed the free energy barrier for one of the rate determining steps along the $\mathbf{A C y 1}$ pathway, $\mathbf{G} \rightarrow \mathbf{R} \mathbf{1}$, using M06$2 \mathrm{X} / 6-31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ level of theory ${ }^{2}$ and compared it with that of PBE/6-31+G(d,p) level of theory. A system consisting of $\mathbf{G}$ and $\mathrm{H}_{3} \mathrm{O}^{+}$ion is taken as the reactant molecule. Here, the transition state (TS) is modeled by considering that the protonation at O5 occurs prior to the ring opening as observed in our metadynamics simulations. PCM (Polarizable Continuum

Figure S56: Optimized structures of $\mathbf{G}-\mathrm{H}_{3} \mathrm{O}^{+}$and TS obtained using M06-2X/6-31+G(d,p) level of theory with important distance (in $\AA$ ) labeled.

Model) solvent model ${ }^{3}$ with water as solvent was used to provide the solvent environment. Bondi's atomic radii ${ }^{4}$ which treat all the atoms of the molecules explicitly was used along with PCM. The level of theory and solvent model used here was used in earlier studies which Table S5: Free energies, $G$ (a.u.) of $\mathbf{G}-\mathrm{H}_{3} \mathrm{O}^{+}$and transition state of step $\mathbf{G 1} \rightarrow \mathbf{R 1}$ (TS) in ABW and SCW obtained using PBE/6-31+G(d,p) and M06-2X/6-31+G(d,p) level of theories.

|  | ABW |  | SCW |  |
| :---: | :---: | :---: | :---: | :---: |
|  | PBE | M06-2X | PBE | M06-2X |
| $\mathbf{G - \mathrm { H } _ { 3 } \mathrm { O } ^ { + }}$ | -763.114834 | -763.645241 | -763.142561 | -763.671179 |
| $\mathbf{T S}$ | -763.081462 | -763.607718 | -763.109993 | -763.635853 |

looked at the various possible dehydration routes of protonated $\beta$-D-glucose and was found to have accuracy comparable to that of MP2. ${ }^{5}$

All the computations were performed using Gaussian 09 suite of programs. ${ }^{6}$ Geometry optimization of reactant and transitions states in implicit solvent were carried out using the GEDIIS ${ }^{7}$ approach as implemented in Gaussian 09 package. To ascertain the nature of minima and TS, normal mode analysis was performed. The nature of TS was further confirmed by the presence of a single imaginary mode. Here, free energies were computed at both the thermodynamic conditions (ABW and SCW) and the computed free energy values include zero-point correction as well as thermal correction to enthalpy and entropy.

It can be seen from Table S6 that PBE functional underestimates the free energy by about $2.6 \mathrm{kcal} \mathrm{mol}^{-1}$ in ABW condition and $2.2 \mathrm{kcal} \mathrm{mol}^{-1}$ in SCW.

Table S6: Free energy barriers, $\Delta G^{\ddagger}$ (in $\mathrm{kcal} \mathrm{mol}^{-1}$ ) for $\mathbf{G 1} \rightarrow \mathbf{R} \mathbf{1}$ in ABW and SCW obtained using $\mathrm{PBE} / 6-31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ and $\mathrm{M} 06-2 \mathrm{X} / 6-31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ level of theories.

|  | PBE | M06-2X |
| :---: | :---: | :---: |
| ABW | 20.9 | 23.5 |
| SCW | 20.4 | 22.2 |

## 7 Accuracy of metadynamics simulations

The accuracy of the metadynamics simulation was verified by recomputing the free energy barriers for the steps $\mathbf{G} \rightarrow \mathbf{F} \mathbf{1}$ and $\mathbf{G} \rightarrow \mathbf{R} \mathbf{1}$ with Gaussian potential heights of 0.38 and $0.19 \mathrm{kcal} \mathrm{mol}^{-1}$ and comparing these barriers with that obtained for a Gaussian potential height of $0.63 \mathrm{kcal} \mathrm{mol}^{-1}$. We have performed these simulations for both ABW and SCW conditions. The reconstructed free energy surfaces from these calculations are given in Figure S57 and Figure S58. The results show that the free energy barriers are converged to $1-2 \mathrm{kcal} \mathrm{mol}^{-1}$ for ABW and SCW conditions with $0.63 \mathrm{kcal} \mathrm{mol}^{-1}$; See Table S7.

Table S7: Free energy barriers $\left(\Delta F^{\ddagger}\right)$ for the steps $\mathbf{G} \rightarrow \mathbf{F} 1$ and $\mathbf{G} \rightarrow \mathbf{R 1}$ at ABW and SCW conditions for different Gaussian potential heights $(w)$.

Figure S58: Reconstructed free energy surfaces for $\mathbf{G} \rightarrow \mathbf{R 1}$ at (a) ABW (b) SCW conditions computed using Gaussian potential height of $0.38 \mathrm{kcal} \mathrm{mol}^{-1}$ and (c) ABW (d) SCW conditions computed with Gaussian potential height of $0.19 \mathrm{kcal} \mathrm{mol}^{-1}$.

## 8 Analysis of ring flipping conformations during step $\mathrm{G} \rightarrow \mathrm{G} 3$

The collective coordinate $\Phi[\mathrm{C} 3-\mathrm{C} 2-\mathrm{C} 1-\mathrm{O} 5]$ was found to aid in sampling various conformational states of $\mathbf{G}$ due to ring puckering. Figure S59 shows the snapshots of the conformational states observed during the simulation. To further quantify, we chose all the energyminimized conformations of ring puckered states as reported in the work of Biarnés et al. ${ }^{8}$ as the reference and computed the root mean square deviation (RMSD) of the metadynamics trajectory (excluding the exo-cyclic groups); see Figure S60. We noticed that RMSD goes below $0.25 \AA$ for all the cases, indicating that these conformational states were indeed visited along the trajectory. Since all the relevant conformations are sampled multiple times during
the metadynamics simulations, the entropic contribution due to these conformational states is naturally accounted in our free energy estimates.

Figure S59: Snapshots of various conformations of $\mathbf{G}$ sampled during the $\mathbf{G} \rightarrow \mathbf{G} 3$ metadynamics simulation. Color codes: C (black), O (red), H (white), solvent molecules (grey colored sticks).

Figure S60: Root mean square deviation (RMSD) (in $\AA$ ) of the pyranose ring (without the exo-cyclic groups) of $\mathbf{G}$ in the metadynamics trajectory (ABW conditions) of $\mathbf{G} \rightarrow \mathbf{G} \mathbf{3}$ reaction. The RMSD is calculated with respect to the reference conformations of $\mathbf{G}$ as labeled in Figure S59. The reference structures were gas phase optimized.

## 9 Analysis of ring opening of G (step G $\rightarrow$ R1)

The ring opening of $\mathbf{G}$ to form $\mathbf{R 1}$ was found to occur by the protonation of O 5 and deprotonation of O1 through a water chain under both ABW and SCW (Figure S61). The ring opening, proton transfer of O5, and deprotonation of O1 occur simultaneously (Figure S62). Metadynamics simulation shows that during the ring opening process, $\mathbf{G}$ converts to an open chain structure R1a before forming a fully extended open chain of glucose, R1. R1a differs from R1 in the distance between O5 and C1. The O5-C1 bond distance was found to be about $3 \AA$ for R1a, whereas for R1 it was found to be about $5 \AA$ (Figure S63).

Figure S61: Snapshots of proton transfer during the ring opening of G at (a) ABW and (b) SCW conditions. Color codes: C (black), O (red), H (white), solvent molecules (grey colored sticks).

Figure S62: C1-O5 bond distance ( $d[\mathrm{C} 1-\mathrm{O} 5]$ ) (black; left Y-axis), coordination number between O 1 and all the hydrogen atoms of hydroxyl groups as well as water $\left(C\left[\mathrm{O} 1-\mathrm{H}_{\mathrm{OH}, \mathrm{w}}\right]\right)$ (blue; right Y-axis), and coordination number of O5 with all the hydrogen atoms of hydroxyl groups as well as water $\left(C\left[\mathrm{O} 5-\mathrm{H}_{\mathrm{OH}, \mathrm{w}}\right]\right)$ (red; right Y-axis) as a function of metadynamics time for the reaction $\mathbf{G} \rightarrow \mathbf{R} \mathbf{1}$ under ABW condition.

Figure S63: C1-O5 bond distance $(d[\mathrm{C} 1-\mathrm{O} 5])$ as a function of metadynamics time for the step $\mathbf{G} \rightarrow \mathbf{R} 1$ under ABW (black; bottom X-axis and left Y-axis) and SCW (red; top X-axis and right Y -axis).

[^0]:    ${ }^{1}$ It was found that in SCW, F1 forms G1. Therefore, free energy barrier for $\mathbf{F} \mathbf{1} \rightarrow \mathbf{G}$ in SCW was computed by adding the free energy barrier for $\mathbf{G 1} \rightarrow \mathbf{G}$ with that of $\mathbf{F} \mathbf{1} \rightarrow \mathbf{G 1}$.
