## 1. Synthetic schemes

Schemes S1 and S2 show the synthetic routes used to obtain the 2-carboxyphthalanilic acid (CPA) and pillararenes (P5A and P6A), respectively.

Scheme S1 - Synthetic route to obtain CPA.

Scheme S2 - Synthetic routes to obtain P5A and P6A.

## 2. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectra

Figure S1a - ${ }^{1} \mathrm{H}$ NMR spectrum of compound $\mathbf{3}$ (DMSO-D ${ }_{6} ; 200 \mathrm{MHz} ; 25.0^{\circ} \mathrm{C}$; TMS).

Figure S1b $-{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum of compound 3 (DMSO-D $6 ; 50 \mathrm{MHz} ; 25.0^{\circ} \mathrm{C}$; residual solvent as reference).

Figure S2a $-{ }^{1} \mathrm{H}$ NMR spectrum of compound 4 (CPA) (DMSO-D $6 ; 200 \mathrm{MHz} ; 25.0^{\circ} \mathrm{C}$; TMS).

Figure $\mathrm{S} 2 \mathrm{~b}-{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum of compound 4 (CPA) (DMSO-D ${ }_{6}$; $50 \mathrm{MHz} ; 25.0$ ${ }^{\circ} \mathrm{C}$; residual solvent as reference).

## 3. HRMS/ESI-TOF spectra

The HRMS spectra of pillararenes were recorded by using a Bruker Daltonics -micrOTOF-Q II/ESI-Qq-TOF mass spectrometer.

Figure S3 - HRMS/ESI-TOF spectra of aqueous solutions of P5A (A and B) and P6A (C and $\mathbf{D}$ ) in positive ion mode.

## 4. Product characterization

(1) ${ }^{1} \mathbf{H}$ NMR: The products were first confirmed by the comparison between $\mathbf{A}$ and $\mathbf{B}$ spectra (Figure S4), corresponding to the aqueous solutions of the fully hydrolyzed CPA ( 25.5 mM ) and a mixture of anthranilic acid ( 28.50 mM ) and phthalic anhydride $(23.31 \mathrm{mM})$, respectively. For confirmation, to the same samples acetonitrile was added to observe the variation of the chemical shifts of the aromatic protons ( $\mathbf{C}$ and $\mathbf{D}$ spectra).

Figure S4 $-{ }^{1} \mathrm{H}$ NMR spectra of aqueous solutions of fully hydrolyzed CPA (A) and a mixture of anthranilic acid and phthalic anhydride (B). Acetonitrile was added to hydrolyzed CPA (C) and to the mixture of anthranilic acid and phthalic anhydride (D). (200 MHz; $25.0^{\circ} \mathrm{C}$; TMSP).
(2) Capillary Electrophoresis/DAD-UV (CE): The products were also confirmed by CE analysis using an Agilent HP 3D Capillary Electrophoresis system with a UV-Vis diode-array detector set at $214 \mathrm{~nm}\left(25^{\circ} \mathrm{C}\right.$ and pH 9.5$)$, as shown in Figure S 5 .

Figure S5 - CZE/DAD-UV electropherogram of fully hydrolyzed CPA (A), anthranilic acid (B) and phthalic anhydride (C), at $25^{\circ} \mathrm{C}$ and pH 9.5 .

## 5. Kinetic data

Table S1 shows the kinetic data for the CPA decomposition in the presence of P5A as a function of the pH (Figure 1A in the manuscript, green data), and Table 2 presents the $k_{\text {obs }}$ values for the rate-concentration profiles at different pH values. (Figure 2A-D in the manuscript). The UV/Vis spectra and the absorbance vs. time profiles from which the $k_{\text {obs }}$ values were calculated are present sequentially. For the kinetics at higher pHs , the $k_{\text {obs }}$ values were calculated by the initial velocity method. All $k_{\text {obs }}$ were determined by appearance of the anthranilic acid at $330-350 \mathrm{~nm}$. Positively ionizable buffers were preferred for use in the experiments to minimize the electrostatic interactions with pillararenes: HEPES, aniline and Bis-Tris methane. Experiments at four different buffer concentrations ( $10 \mathrm{mM} ; 20 \mathrm{mM} ; 30 \mathrm{mM}$ and 40 mM ) were performed to subtract their effects on $k_{\text {obs }}$. For this, the buffer concentrations were extrapolated up to 0 mM to obtain the exact $k_{\text {obs }}$ of CPA decomposition inside the cavity of the pillararenes.

Table S1. Influence of pH on the $k_{\text {obs }}$ for CPA decomposition in P5A cavity ([CPA] $=1.0$ $\times 10^{-4} \mathrm{M}^{-1} ;\left([\mathrm{P} 5 \mathrm{~A}]=4.0 \times 10^{-4} \mathrm{M}^{-1} ; 25.0^{\circ} \mathrm{C}\right)$.

- $\mathbf{p H} 4.99$

- pH 5.68

- pH 6.40

Influence of P5A concentration on CPA decomposition at different $\mathbf{p H s}$

## pH 2.50

$[\mathrm{P} 5 \mathrm{~A}]=0 \mathrm{M}$

$[\mathrm{P5A}]=1.20 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=4.00 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=6.00 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=1.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=3.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=5.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=8.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=1.00 \times 10^{-4} \mathrm{M}$

$$
[\mathrm{P} 5 \mathrm{~A}]=3.00 \times 10^{-4} \mathrm{M}
$$

$[\mathrm{P} 5 \mathrm{~A}]=5.00 \times 10^{-4} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=2.00 \times 10^{-\mathbf{3}} \mathrm{M}$

## pH 3.45

$[\mathrm{P} 5 \mathrm{~A}]=0 \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=1.20 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=4.00 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=6.00 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=8.00 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=1.00 \times 10^{-5} \mathrm{M}$

For concentrations greater than $3.00 \times 10^{-5} \mathrm{M}$, the absorbance changes presented a gradually different behavior from a typical first-order profile. This is probably due to a competition between CPA and one or both fragments of its decomposition for the P5A cavity. Thus, the $k_{\text {obs }}$ were calculated by the initial velocity method.

$[\mathrm{P} 5 \mathrm{~A}]=5.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=8.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=1.00 \times 10^{-4} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=8.00 \times 10^{-4} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=2.00 \times 10^{-3} \mathrm{M}$

## pH 4.25

$[\mathrm{P} 5 \mathrm{~A}]=0 \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=1.20 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=4.00 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=8.00 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=3.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=5.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=8.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=1.00 \times 10^{-4} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=3.00 \times 10^{-4} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=8.00 \times 10^{-4} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=2.00 \times 10^{-3} \mathrm{M}$

## pH 6.00

$[\mathrm{P} 5 \mathrm{~A}]=2.00 \times 10^{-6} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=2.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=8.00 \times 10^{-5} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=2.00 \times 10^{-4} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=4.00 \times 10^{-4} \mathrm{M}$

$[\mathrm{P} 5 \mathrm{~A}]=1.20 \times 10^{-3} \mathrm{M}$

## 6. Treatment of the kinetic data

## 6.1 pH -rate profile

The kinetic data of Figure 1A (see manuscript) were fitted using the Equation S1 that describes the observed rate constant ( $k_{\mathrm{obs}}$ ) as a function of the CPA species distribution. We used the same equation to evaluate parameters (rate constants and $\mathrm{p} K_{\mathrm{a}}$ ) in the P5A cavity. For this, we use excess of P5A to promote total complexation. Scheme 2 (see manuscript) describes all acidity equilibria and rate constants in both environments ( $\mathrm{H}_{2} \mathrm{O}$ and P 5 A cavity).

$$
\begin{equation*}
k_{o b s}=\frac{k_{1}}{1+\frac{K_{\mathrm{a} 1}}{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}+\frac{K_{\mathrm{a} 1} K_{\mathrm{a} 2}}{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}}}+\frac{k_{2}}{1+\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{K_{\mathrm{a} 1}}+\frac{K_{\mathrm{a} 2}}{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}}+\frac{k_{3}}{1+\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{K_{\mathrm{a} 2}}+\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2}}{K_{\mathrm{a} 1} K_{\mathrm{a} 2}}} \tag{S1}
\end{equation*}
$$

$k_{1}, k_{2}$ and $k_{3}$ are the rate constants of the neutral $\left(\mathrm{CPAH}_{2}\right)$, monoanionic $\left(\mathrm{CPAH}^{-}\right)$and dianionic ( $\mathrm{CPA}^{2-}$ ) species, respectively; $K_{\mathrm{a} 1}$ and $K_{\mathrm{a} 2}$ are the acidity constants.

### 6.2 Distribution of the CPA species at $\mathrm{pHs} 2.50,3.45$ and 4.25

Equation S 1 determined the values of $\mathrm{p} K_{\mathrm{a}} \mathrm{S}$ in both $\mathrm{H}_{2} \mathrm{O}$ and P5A. From this, Table S3 shows the molar fractions of the CPA species as a function of pH , for both environments.

Table S3. Molar fractions of the CPA species at $\mathrm{pHs} 2.50,3.45$ and 4.25 , for both environments.

| $\mathbf{p H}$ | Environment | $\mathbf{C P A H}_{\mathbf{2}}$ | $\mathbf{C P A H}^{-}$ | $\mathbf{C P A}^{\mathbf{2 -}}$ |
| :--- | :---: | :---: | :---: | :---: |
| $\mathbf{2 . 5 0}$ | $\mathbf{H}_{\mathbf{2}} \mathbf{O}$ | $85.5 \%$ | $13.6 \%$ | $0.9 \%$ |
|  | $\mathbf{P 5 A}$ | $52.5 \%$ | $34.6 \%$ | $12.9 \%$ |
| $\mathbf{4 . 2 5}$ | $\mathbf{H}_{\mathbf{2}} \mathbf{O}$ | $31.2 \%$ | $44.0 \%$ | $24.8 \%$ |
|  | $\mathbf{P 5 A}$ | $3.8 \%$ | $22.3 \%$ | $73.9 \%$ |

### 6.3 Rate vs. P5A concentration

The experiments of $k_{\text {obs }}$ vs. [P5A] showed inhibitory effects on CPA decomposition, reaching a plateau at approximately $4.0 \times 10^{-4} \mathrm{M}$ (4 equiv). This effect can be explained by the host-guest complexation of CPA in the P5A cavity, with the reaction occurring in both environments ( $\mathrm{H}_{2} \mathrm{O}$ and P5A). Therefore, the $k_{\mathrm{obs}}$ is the sum of the rate constants in both environments weighted by their molar fractions. For this, we consider the possibility of complexation in $\mathrm{H}: \mathrm{G}$ and $\mathrm{H}: \mathrm{G}_{2}$ stoichiometries for fitting data, as described below:

## H:G stoichiometry

$$
\begin{gather*}
k_{o b s}=k_{w} X_{w}+k_{1: 1} X_{1: 1}  \tag{S2}\\
X_{w}=\frac{1}{1+K_{1: 1}[P 5 A]} \quad X_{1: 1}=\frac{K_{1: 1}[P 5 A]}{1+K_{1: 1}[P 5 A]}
\end{gather*}
$$

$k_{w}$ and $k_{1: 1}$ are the rate constants in $\mathrm{H}_{2} \mathrm{O}$ and P5A cavity, respectively; $X_{w}$ and $X_{1: 1}$ are the molar fractions of CPA in $\mathrm{H}_{2} \mathrm{O}$ and P5A cavity, respectively.

## $\mathrm{H}: \mathrm{G}_{2}$ stoichimetry

$$
\begin{gather*}
k_{o b s}=k_{w} X_{w}+k_{1: 1} X_{1: 1}+k_{1: 2} X_{1: 2}  \tag{S3}\\
X_{w}=\frac{1}{1+K_{1: 1}[P 5 A]+K_{1: 1} K_{1: 2}[P 5 A]^{2}} \\
X_{1: 1}=\frac{K_{1: 1}[P 5 A]}{1+K_{1: 1}[P 5 A]+K_{1: 1} K_{1: 2}[P 5 A]^{2}} \\
X_{1: 2}=\frac{K_{1: 1} K_{1: 2}[P 5 A]^{2}}{1+K_{1: 1}[P 5 A]+K_{1: 1} K_{1: 2}[P 5 A]^{2}}
\end{gather*}
$$

$k_{1: 1}$ and $k_{1: 2}$ are the rate constants in the systems $\mathrm{H}: \mathrm{G}$ and $\mathrm{H}: \mathrm{G}_{2}$, respectively; $X_{1: 1}$ and $X_{1: 2}$ are the molar fractions of the $\mathrm{H}: \mathrm{G}$ and $\mathrm{H}: \mathrm{G}_{2}$ complexes, respectively; $K_{1: 1}$ and $K_{1: 2}$ are the association constants of formation of the $\mathrm{H}: \mathrm{G}$ and $\mathrm{H}: \mathrm{G}_{2}$ complexes, respectively.

## 7. NMR experiments

### 7.1 COSY and HETCOR

The CPA aromatic protons were identify by COSY and HETCOR. Protons derived from anthranilic acid (blue protons) were named $\mathrm{H} a, \mathrm{H} b, \mathrm{H} c$ and $\mathrm{H} d$. Protons derived from phthalic anhydride (green protons) were named $\mathrm{H} e, \mathrm{H} f, \mathrm{Hg}$ and $\mathrm{H} h$.

Figure S6 - (Left) COSY and (Right) HETCOR spectra of CPA (DMSO/TMS, 400 MHz ).

## 7.2 ${ }^{1} \mathrm{H}$ NMR titration

After identification of all CPA aromatic protons, the ${ }^{1} \mathrm{H}$ NMR titration were carried out. Figure 4 (see manuscript) shows the chemical shift changes of all CPA aromatic protons in the presence of different P5A equivalents. Figures S7a-b show, in more details, some experimental evidence that complements the discussion in the manuscript. For this, we set the successive spectra in different magnifications for better visualization.

Figure S 7 a - Splitting of the $\mathrm{H} c$ proton due to very different environments in asymmetric complexation in $\mathrm{CPA}^{2-} \subset$ P5AつCPA ${ }^{2-}$ system.

Figure S7b - Splitting of the aliphatic protons of P5A (H2 >> H3) due to very different environments in asymmetric complexation in $\mathrm{CPA}^{2-} \subset \mathrm{P} 5 \mathrm{~A} \supset \mathrm{CPA}^{2-}$ system.

Although P6A does not show significant kinetic influence on CPA decomposition, a ${ }^{1} \mathrm{H}$ NMR titration was performed to investigate the formation of host-guest complexes. The data
showed very small spectral changes for all CPA protons (Figure S8) as well as large fluctuations in their binding isotherms (Figure S9-Left).

Figure S8 - Chemical shifts of the CPA protons as a function of P6A equivalents (pD 7.0; [BisTris propane] $=0.01 \mathrm{M} ; 25.0^{\circ} \mathrm{C} ; 200 \mathrm{MHz}$.

These data together with the inaccurate saturation of the binding isotherms in $[\mathrm{P} 6 \mathrm{~A}]_{0} /[\mathrm{CPA}]_{0} \cong 0.5$ suggest that two dianionic CPA interact externally with two portals of the P6A. This provides an understanding of the non-formation of host-guest complexes, only interactions external to the P6A cavity with electrostatic interactions acting as the main driving force. This behavior explains the inhibitory effect of only 2.5 -fold on the CPA decomposition, where its carboxyl groups remain free to perform intramolecular bifunctional catalysis (Figure S9-Right).

Figure $\mathrm{S} 9-\Delta \delta v s .[\mathrm{P} 6 \mathrm{~A}]_{0} /[\mathrm{CPA}]_{0}$ for CPA protons (Left) and one possible structure for external interactions between CPA ${ }^{2-}$ and P6A (Right).

### 7.3 Treatment of the NMR data

The graphics of $\Delta \delta v s$. $[\mathrm{P} 5 \mathrm{~A}]_{0}$ were fitted as $\mathrm{H}: \mathrm{G}$ and $\mathrm{H}: \mathrm{G}_{2}$ to investigate the stoichiometry, cooperativity and magnitude of $K^{\mathrm{G}}$. For this, we use different models, ${ }^{1}$ all presented below:

## H:G stoichiometry

Assuming only the existence of the $\mathrm{H}: \mathrm{G}$ complex $(\mathrm{H}+\mathrm{G} \rightleftharpoons \mathrm{H}: \mathrm{G})$, the binding constant is defined by:

$$
K_{1: 1}=\frac{[\mathrm{H}: \mathrm{G}]}{[\mathrm{H}] \cdot[\mathrm{G}]}
$$

Due to the free concentrations cannot be measured directly, an alternative approach to use $[\mathrm{P5A}]_{0}$ and $[\mathrm{CPA}]_{0}$ can be solved, reaching:

$$
[\mathrm{H}: \mathrm{G}]=\frac{1}{2}\left\{[\mathrm{P} 5 \mathrm{~A}]_{0}+[\mathrm{CPA}]_{0}+\frac{1}{K_{1: 1}}-\sqrt{\left([\mathrm{P} 5 \mathrm{~A}]_{0}+[\mathrm{CPA}]_{0}+\frac{1}{K_{1: 1}}\right)^{2}-4[\mathrm{P} 5 \mathrm{~A}]_{0}[\mathrm{CPA}]_{0}}\right\}
$$

Lastly, the experimental data was fitted with the Equation S4:

$$
\begin{equation*}
\Delta \delta=\delta_{1: 1}\left(\frac{[\mathrm{H}: \mathrm{G}]}{[\mathrm{H}]_{0}}\right) \tag{S4}
\end{equation*}
$$

## H:G2 stoichiometry

Assuming the existence of high order complexes $\left(\mathrm{H}+\mathrm{G} \rightleftharpoons \mathrm{H}: \mathrm{G}+\mathrm{G} \rightleftharpoons \mathrm{H}: \mathrm{G}_{2}\right)$, the macroscopic binding constants are defined by:

$$
K_{1: 1}=\frac{[\mathrm{H}: \mathrm{G}]}{[\mathrm{H}] \cdot[\mathrm{G}]} \quad K_{1: 2}=\frac{\left[\mathrm{H}: \mathrm{G}_{2}\right]}{[\mathrm{H}: \mathrm{G}] \cdot[\mathrm{G}]}
$$

Thus, the free CPA concentration can be determined by the cubic equation below:

$$
a[\mathrm{CPA}]^{3}+b[\mathrm{CPA}]^{2}+c[\mathrm{CPA}]-[\mathrm{CPA}]_{0}=0
$$

Where:

$$
\begin{gathered}
a=K_{1: 1} K_{1: 2} \\
b=K_{1: 1}\left(2 K_{1: 2}[\mathrm{P} 5 \mathrm{~A}]_{0}-K_{1: 2}[\mathrm{CPA}]_{0}+1\right) \\
c=K_{1: 1}\left([\mathrm{P} 5 \mathrm{~A}]_{0}-[\mathrm{CPA}]_{0}\right)+1
\end{gathered}
$$

Lastly, the experimental data was fitted with the Equation S5:

$$
\begin{equation*}
\Delta \delta=\frac{\delta_{1: 1} K_{1: 1}[\mathrm{CPA}]+\delta_{1: 2} K_{1: 1} K_{1: 2}[\mathrm{CPA}]^{2}}{1+K_{1: 1}[\mathrm{CPA}]+K_{1: 1} K_{1: 2}[\mathrm{CPA}]^{2}} \tag{S5}
\end{equation*}
$$

For fitting data in $\mathrm{H}: \mathrm{G}_{2}$ stoichiometry we used the BindFit online tool. Table S 4 shows the values of $K_{1: 1}$ and $K_{1: 2}$ for all CPA protons. As mentioned in the manuscript, these data were treated qualitatively due to the relationship $K_{1: 1} \ll K_{1: 2}$ being able to generate
errors and negative coefficient to $\mathrm{H}: \mathrm{G}$ stoichiometry $\left(-\delta_{1: 1}\right) .{ }^{2}$ To access each data file click in BindFit (blue link).

Table S4. Equilibrium constants for all $\mathrm{CPA}^{2-}$ protons obtained from fitting experimental data to Equation S5 (using BindFit online tool, supramolecular.org).

| Proton | Link | $\boldsymbol{K}_{\mathbf{1 : 1}}\left(\mathbf{M}^{-\mathbf{1}}\right)$ | $\boldsymbol{K}_{\mathbf{1 : 2}}\left(\mathbf{M}^{-\mathbf{1}}\right)$ |
| :---: | :---: | :---: | :---: |
| $\boldsymbol{a}$ | BindFit | $1.21 \times 10^{-2} \pm 2.9 \%$ | $8.45 \times 10^{4} \pm 1.7 \%$ |
| $\boldsymbol{b}$ | BindFit | $4.21 \times 10^{-2} \pm 3.3 \%$ | $1.41 \times 10^{5} \pm 2.3 \%$ |
| $\boldsymbol{c}$ | BindFit | $6.00 \times 10^{-2} \pm 15.7 \%$ | $3.11 \times 10^{5} \pm 11.8 \%$ |
| $\boldsymbol{d}$ | BindFit | $7.17 \times 10^{-3} \pm 1.4 \%$ | $1.72 \times 10^{5} \pm 0.8 \%$ |
| $\boldsymbol{e}-\boldsymbol{h}$ | BindFit | $2.03 \times 10^{-2} \pm 9.1 \%$ | $4.22 \times 10^{5} \pm 6.8 \%$ |
| $\mathbf{N}-\mathbf{H}$ | BindFit | $1.32 \times 10^{-2} \pm 5.7 \%$ | $3.42 \times 10^{5} \pm 4.1 \%$ |
