Chemical Methods. All commercial chemicals and solvents were reagent grade and used without further purification. Air-sensitive reactions were performed under Argon atmosphere. Microwave reactions were performed on Biotage Initiator. Column chromatography was performed using Biotage Isolera instrument and Silica gel SNAP columns. Analytical thin layer chromatography was performed on Merck $250 \mu \mathrm{M}$ silica gel $\mathrm{F}_{254}$ plates, and preparative thin layer chromatography on Merck $1000 \mu \mathrm{M}$ silica gel $\mathrm{F}_{254}$ plates obtained from EMD Millipore corporation. The identity of each product was determined using mass spectrometry (MS: Thermo Scientific LTQ XL; LC: Thermo Scientific Dionex Ultimate 3000) and NMR (Bruker 400 or 600 MHz instrument) using $\mathrm{CDCl}_{3}$ as solvents unless otherwise mentioned. Chemical shifts are reported in $\delta$ values in ppm downfield from TMS as the internal standard. ${ }^{1} \mathrm{H}$ data are reported as follows: chemical shift, multiplicity $(\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{br}=\mathrm{broad}, \mathrm{m}=$ multiplet), coupling constant $(\mathrm{Hz})$, integration.

1. Synthesis of key intermediates 7a-c. Compound 7a was prepared by reacting aldehyde $\mathbf{1 0}$ with acetonitrile derivative 11, as described elsewhere, followed by m-CPBA oxidation of the resulting product $6 \mathbf{6}$ (Scheme S-1, upper). ${ }^{1}$ Alternatively, compound $6 \mathbf{a}$ was also prepared by reacting aldehyde 10 with ester 12a, as described by Zhang, et al. ${ }^{2}$ except that the reaction was performed in DMA. Compounds $\mathbf{7 b}$ and $\mathbf{7 c}$ were prepared starting with $3,4,5$-trichloronitrobenzene, $\mathbf{1 3}$, and converting the latter to 12b and 12c in 4 steps via a common amine intermediate 12 (Scheme S-1, lower).

Subsequently, compounds $\mathbf{1 2 b}$ and $\mathbf{1 2 c}$ reacted with aldehyde $\mathbf{1 3}$, as described for the synthesis of $\mathbf{6 a},{ }^{2}$ and the resulting products $\mathbf{6 b}$ and $\mathbf{6 c}$ were treated with m-CPBA to give $\mathbf{7 b}$ and $\mathbf{7 c}$.

## 4. Screening and evaluation of PD173955 analogs.

Cell lines, antibodies, and reagents and kits for evaluation of compounds. N2a695 cells used to screen and evaluate 3a analogs were available in house, and were cultured in 1:1 OptiMem Reduced Serum Media (Life Technologies): Dulbecco’s Modified Eagle Medium ([+] $4.5 \mathrm{~g} / \mathrm{L}$ D-glucose; [+] L-

Glutamine; [-] Sodium pyruvate (Life Technologies) supplemented with $5 \%$ fetal bovine serum, $0.4 \%$ Penstrep and $0.4 \%$ Geneticin and incubated at $37^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2} .96$-Well ELISA plate for human $\mathrm{A} \beta 40$ peptide and V-Plex Plus MSD plate for A $\beta$ Peptide Panel 1 (6E10) Kit (Catalog number K15200G) were obtained from Thermo Fischer and Meso Scale Discovery.
4.1. A $\boldsymbol{\beta}$ activity assay. Typically, 6 -well tissue culture plates (Corning) were seeded with N2a695 cells at $4.0 \times 10^{5}-4.5 \times 10^{5} \mathrm{~N} 2 \mathrm{a} 695$ cells $/ \mathrm{mL}, 2 \mathrm{~mL} /$ well for overnight incubation. Upon overnight incubation at $37^{\circ} \mathrm{C}$ under $5 \% \mathrm{CO}_{2}$ atmosphere, media were exchanged with fresh media containing $10 \mu \mathrm{M}$ solution of compounds (prepared from 10 mM solution in DMSO), and cells ( $>95 \%$ confluent) were further incubated for 5 hrs. Appropriate dilution of compounds was performed in DMSO before adding to media for lower concentrations. After cells were incubated with compounds for 5 h at $37{ }^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2}$, culture media were collected. To measure soluble $A \beta$ concentrations in culture media, these were transferred to strips of 96-well plate for human A $\beta 40$ peptide (and A $\beta 42$ peptide or to 96 -well V-Plex Plus MSD (Mesoscale Discovery) plate for A $\beta$ Peptide Panel 1 (6E10) Kit (Catalog number K15200G)) and processed as per manufacturer instructions. Signals for $A \beta$ were measured using Perkin Elmer Envision and SQ120 MSD ELISA reader.

Figure S-1. Screening of PD173955 analogs 3a-p, 4a-m, and 5a-n using N2a695 cells. Shown are average of 2 (in some case 1) independent assays in duplicates. Compound $\mathbf{4 g}$ produced $A \beta$ greater than $150 \%$ of DMSO control and is out of scale. We identified nine compounds, $\mathbf{3 c}, \mathbf{3 1}-\mathbf{m}, \mathbf{4 m}, \mathbf{5 b}-\mathbf{d}, \mathbf{5 f}$, and 51 showing reduction of $\mathrm{A} \beta$ equal or greater than $\mathbf{1}$ for further evaluation.
4.2. In vitro kinase activity assay. The assay was performed by Luceome Biotechnolgies, LLC, using the general methods, as described. ${ }^{5}$
4.3. MTT assay. A 96-well plate was seeded with N 2 a 695 cells ( 100,000 cells $/ \mathrm{ml}, 200 \mu \mathrm{l}$ ) and kept in incubator stabilized at $37{ }^{\circ} \mathrm{C}$ and $5 \% \mathrm{CO}_{2}$ atmosphere. Media of the cells were exchanged with new media ( $100 \mu \mathrm{l}$ ) containing compounds ( $10 \mu \mathrm{M}$ or appropriate concentration) or DMSO and Media alone (for controls) 24 hours later, and the plate was placed back in the incubator for another 5 or 24 h , as needed. MTT reagent ( $1: 10$ dilution using Media, $100 \mu \mathrm{l}$ ) was added to each well. Three hours later, solubilization buffer ( $100 \mu \mathrm{l}$ ) was added to each well and kept at $37{ }^{\circ} \mathrm{C}$ overnight to solubilize the formazan crystals, before the plate was cooled to room temperature and the absorbance was measured at 560 nm and 650 nm wavelength. The data were processed as described in product manual.

Figure S-2. Cellular toxicity of potent PD173955 analogs. Shown are cell viability of $\mathbf{2}$ and 9 potent analogs of 2 at 1 and $10 \mu \mathrm{M}$ concentrations, respectively, in A and B , and dose dependence of 3 potentially toxic compounds in C and D, in 5- and 24-hours assays. Assays were performed in triplicates, and cell viability was determined as \% of DMSO control.

### 4.4. APP metabolism study using supernatants from N2a cell transfected with APP-FL and C-99.

N2a cells were transfected with full length APP (APP-FL) or with C-99. After 48 hours, media were exchanged with fresh media containing compound 3a and analogs. Following 5 hours of incubation, cell supernatants were collected, and analyzed using MSD-ELISA to determine A $\beta 40$ and $\mathrm{A} \beta 42$.

Figure S-3. Effects of 3a analogs on production of $\mathrm{A} \beta 42$ peptide in N2a cells transfected with human (A) APP-FL or (B) APP-C99, measured by ELISA. DAPT is used as a positive control, and MK8931 is used as positive control in C and a negative control in D . All experiments were performed in duplicates, and results shown here are the representative of 2 independent experiments.
