Figure S1. A photograph of the in-Situ electrochemical FTIR cell setup.

Figure S2. The reference spectra collected at the potential of 0.2 V vs RHE in a $0.1 \mathrm{M} \mathrm{Na}_{2} \mathrm{SO}_{4}$ saturated with $\mathrm{CO}_{2}$, where either $\mathrm{H}_{2} \mathrm{O}$ or $\mathrm{D}_{2} \mathrm{O}$ was used as the solvent.

Figure S3. XRD patterns of Ti/Au (blue) and Ti plate (red).

Figure S4. Steady current densities at 50 s from Fig. 3(c) at various applied potentials.

Figure S5. $\mathrm{CO}_{2}$ consumption peaks in $\mathrm{H}_{2} \mathrm{O}$ (a) and in $\mathrm{D}_{2} \mathrm{O}\left(\right.$ b) at $2344 \mathrm{~cm}^{-1}$ from SNIFTIR spectra on the Au electrode following saturation with $\mathrm{CO}_{2}$ in a $0.10 \mathrm{M} \mathrm{Na}_{2} \mathrm{SO}_{4}$ solution every eight seconds, from 0 second to 80 seconds under an applied potential of $-0.50 \mathrm{~V} . \Delta \mathrm{R} / \mathrm{R}=\left(\mathrm{R}_{\mathrm{E} 2}-\mathrm{R}_{\mathrm{E} 1}\right) / \mathrm{R}_{\mathrm{E1}}$, where the reference spectrum $\mathrm{R}_{\mathrm{E} 1}$ was taken at $\mathrm{E}=0.20 \mathrm{~V}$.

Figure S6. $\mathrm{CO}_{2}$ consumption peak areas at $2344 \mathrm{~cm}^{-1}$ from SNIFTIR spectra every eight seconds, from 0 second to 80 seconds on the Au following saturation with $\mathrm{CO}_{2}$ in a $0.10 \mathrm{M} \mathrm{Na}_{2} \mathrm{SO}_{4}$ solution in $\mathrm{H}_{2} \mathrm{O}$, under an applied potential -0.50 V .

Table S1. Peak positions $\left(\mathrm{cm}^{-1}\right)$ present in $0.10 \mathrm{M} \mathrm{Na}_{2} \mathrm{SO}_{4}$ with $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{D}_{2} \mathrm{O}$ and their assignments.
