# S1 Dataset

An overview of the dataset, including the number of actives, decoys, and clusters for each target can be seen in Table S1. We have included the PDB code and the PubChem CID for each search query.

Table S1: Overview of the used data sets. It shows the number of actives, decoys, and clusters for each target class, target RCSB Protein Data Bank (PDB) code, and PubChem Compound ID number (CID) for each search query of target classes.

Target class	Number of actives	Number of decoys	Number of clusters	Target PDB code	Query PubChem CID

## S2 Criticality and Weighting Schemes

For each feature presented in Table 1, we have set its value to critical (C), non-critical (NC), or off (OFF). Bond order, formal charge, and degree have been set to NC and pharmacophore features have been set to C. For the remaining set of features, we have set various combinations of values as presented in Table S2. Each combination is called a *criticality scheme* (CS). In total, we have generated 12 CSs.

Table S2: Criticality Schemes

Features	$CS_1$	$CS_2$	$CS_3$	$CS_4$	$CS_5$	$CS_6$	$CS_7$	$CS_8$	$CS_9$	$CS_{10}$	$CS_{11}$	$CS_{12}$
Atomic number (single atom)	C	C	C	NC	NC	NC	C	C	C	NC	NC	NC
Atomic number (ring)	C	C	OFF	NC	NC	OFF	C	C	OFF	NC	NC	OFF
Implicit hydrogen	NC	OFF	OFF	NC	OFF	OFF	NC	OFF	OFF	NC	OFF	OFF
Dimensionality	2D	2D	2D	2D	2D	2D	3D	3D	3D	3D	3D	3D

In addition to identifying the features as C or NC, we have assigned them a weighting value to reflect its relevance in the virtual screening (VS) experiments. Each combination of weighting values is called a *weighting scheme* (WS). We set one WS as baseline  $WS_B$ , with every feature equally weighted to act as a control. In total we have 10 WSs, shown in Table S3.

Table S3: Weighting Schemes

Features	$WS_B$	$WS_1$	$WS_2$	$WS_3$	$WS_4$	$WS_{B-5}$	$WS_{1-5}$	$WS_{2-5}$	$WS_{3-5}$	$WS_{4-5}$

## S3 Solver Parameters

The algorithm used to solve the maximum weighted co-1-plex problem is the parallel tempering Monte Carlo with isoenergetic cluster moves (PTICM) heuristic solver, also known as the “borealis” algorithm.<sup>2</sup> The performance of replica-exchange algorithms, such as the PTICM algorithm, depends on the parameters used, especially the temperature schedule selected. In the main paper, the temperature schedule has been based on the geometric schedule for each replica. The low and high temperature values are determined based on the

values of the coefficients of each quadratic unconstrained binary optimization (QUBO) problem instance. Specifically, we set the high temperature equivalent to the maximum coefficient of the terms in the QUBO problem instance, and we set the low temperature to a tenth of the high temperature. We set the number of replicas to be two and the number of sweeps per run to be 100.

### S3.1 Runtimes

A complete overview of the solver runtime for each target class is shown in Table S4

Table S4: Runtimes (in seconds)

Target Class	mean	std	max	75%	50%	25%	min

## S4 Overall VS Performance for the GMS and Fingerprint Methods

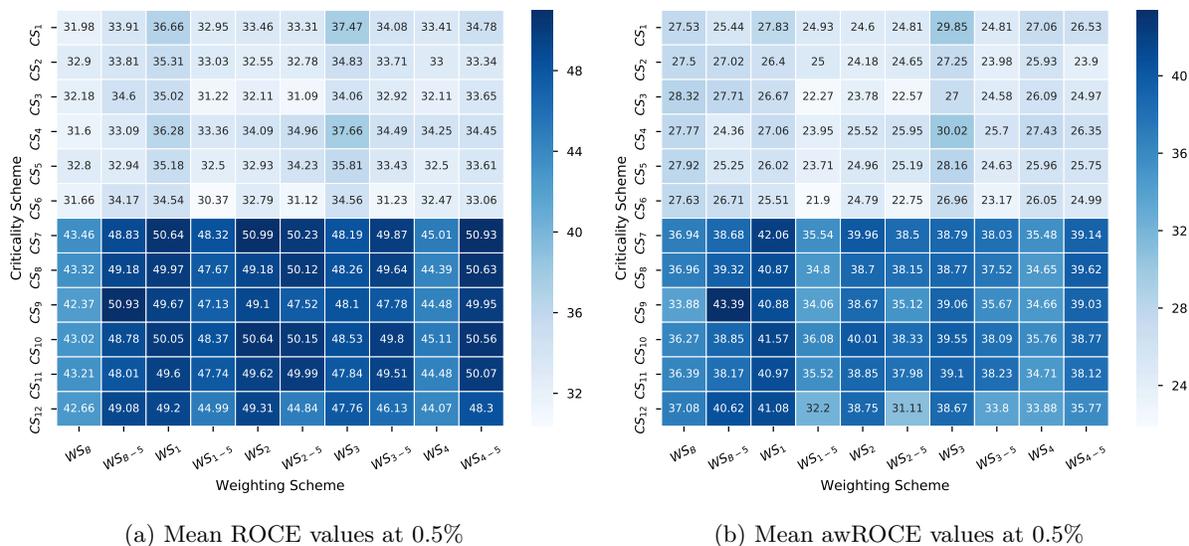

Figure S1: Overall VS performance for each GMS method: a) mean ROCE and b) mean awROCE values at 0.5% over 13 targets in the DUD\_LIB\_VS\_1.0 library

Table S5: Overall VS performance for MACCS and Morgan fingerprints. For Morgan fingerprints, we consider four radii and two bit-vector sizes. We also compare the use of feature-based invariants. We report the mean ROCE and mean awROCE at values at 0.5% over 13 targets in the DUD\_LIB\_VS\_1.0 library

Fingerprint	Bits	Radius	Use Features	Mean ROCE 0.5%	Mean awROCE 0.5%
MACCS	N/A	N/A	N/A	23.79	16.86
Morgan	1024	1	False	41.095	29.160
Morgan	1024	1	True	29.386	25.178
Morgan	1024	2	False	43.981	33.899
Morgan	1024	2	True	40.116	32.147
Morgan	1024	3	False	43.463	32.502
Morgan	1024	3	True	41.205	33.851
Morgan	1024	4	False	41.786	30.422
Morgan	1024	4	True	40.216	29.738
Morgan	2048	1	False	41.910	29.445
