General Chemistry: All reagents from commercial sources were used without further purification unless otherwise noted. ${ }^{1} \mathrm{H}$-NMR spectra were taken in DMSO-d6, MeOD or $\mathrm{CDCl}_{3}$ at room temperature on: Varian MR 400 MHz ; Varian Vnmrs 500 MHz ; and Varian Vnmrs 700 MHz instruments. The reported chemical shifts for the ${ }^{1} \mathrm{HNMR}$ spectra were recorded in parts per million (ppm) on the $\delta$ scale from an internal tetramethylsilane (TMS) standard ( 0.0 ppm ). Small molecule mass spectrometry data was measured using a Waters Corporation Micromass LCT or Agilent6230 Q-TOF instrument. HPLC was used to determine purity of compounds on an Agilent 1100 series with an Agilent Zorbax Eclipse Plus-C18 column. A gradient of 10-90\% acetonitrile/water over 6 min followed by $90 \%$ acetonitrile/water for 7 min was used with detection at 254 nm .

Intact Protein MS and Tandem MS/MS: Intact protein MS was acquired with a Phenomenex C4 column paired with an Agilent 6545 Q-TOF LC/MS. For intact MS and Tandem MS, all samples were prepared with $20 \mu \mathrm{M}$ GRK in assay buffer (see below), 1 mM compound, and incubated at $4{ }^{\circ} \mathrm{C}$ for 3 hr before being quenched with $1.0 \mu \mathrm{~L}$ of formic acid. In Tandem MS/MS, we chose Glu-C as the restricting enzyme to avoid small fragments with mass-to-charge ratios below the limit of detection of our instrument. ${ }^{1}$ All samples were digested with Glu-C sequencing enzyme, procured from Sigma Aldrich (Roche Life Sciences subsidiary) and used without further purification. MS/MS experiments were run on a nano-LC (Dionex RSLC-nano) with an Orbitrap Fusion Tribrid ETD mass spectrometer. This work was conducted by the Proteomics Resource Facility at the University of Michigan.

Inhibition Assays: For compounds 4-9, $\mathrm{IC}_{50}$ values for human GRK5, bovine GRK2, and bovine GRK1 were determined using a radiometric assay as follows. 50 nM GRK was incubated with 500 nM porcine brain tubulin (Cytoskeleton) and $0-333 \mu \mathrm{M}$ inhibitor in 20 mM HEPES pH 7.0, $2 \mathrm{mM} \mathrm{MgCl} 2,0.025 \%$ dodecylmaltoside (DDM), 3\% DMSO for 20-30 min for GRK1 and 2 and 0-1 hr for GRK5, as denoted in Table 1, on ice, prior to initiation with the addition of $5 \mu \mathrm{M}$ ATP supplemented with radioactive $[\gamma-32 \mathrm{P}$ ]-ATP (PerkinElmer Life Sciences). Reactions were quenched at 5 min by addition of $6 \mu \mathrm{~L}$ of 4 X SDS gel loading dye to the $6 \mu \mathrm{~L}$ reactions. $8 \mu \mathrm{~L}$ samples were separated on a $4-15 \%$ Criterion TGX precast gel (Bio-Rad). Experiments were performed with an $\mathrm{n}=3$ in duplicate.

For the remaining compounds $\mathbf{1 6 a} \mathbf{- 1 6 j}$, $\mathrm{IC}_{50}$ values for human GRK5, bovine GRK2, bovine GRK6, and bovine GRK5-C474S were similarly determined with the following differences. Inhibitors were assessed over the range of $1 \mathrm{nM}-1 \mathrm{mM}$ in 20 mM HEPES pH $7.5,10 \mathrm{mM} \mathrm{NaCl}, 10 \mathrm{mM} \mathrm{MgCl}, 2 \mathrm{mM}$ DTT after a 4 hr incubation at room temperature prior to reaction initiation with ATP. Reactions were quenched at 8 min by transferring 10 $\mu \mathrm{L}$ reaction into $5 \mu \mathrm{~L} 4 \mathrm{X}$ SDS gel loading dye. $10 \mu \mathrm{~L}$ samples were separated on a $4-15 \%$ Criterion TGX precast gel. These conditions were also used to assess compound 5 for GRK5 (4 hr), GRK2, and GRK5-C474S but with the addition of 3\% DMSO (final) to the incubation buffer. Experiments were performed with an $\mathrm{n}=3$ except for assays involving 5 against GRK5, GRK6, and GRK5-C474S with 4 hr incubations, which were performed 4 times.

For compounds 5 and 16d, $\mathrm{IC}_{50}$ values were also determined when opsin was used as the substrate. 50 nM of GRK5 were preincubated with $0-750 \mu \mathrm{M}$ inhibitor in buffer containing 20 mM HEPES $\mathrm{pH} 7.0,2 \mathrm{mM} \mathrm{MgCl} 2,0.025 \%$ dodecylmaltoside (DDM), $3 \%$ DMSO for $0,30,60$ or 240 min . Rhodopsin in the rod outer segment was exposed to the light for approximately 3 min right before phosphorylation. $5 \mu \mathrm{M}$ ATP supplemented with radioactive $\left[\gamma-{ }^{32} \mathrm{P}\right]$-ATP (PerkinElmer Life Sciences) was added to initiate the reaction. Reactions were quenched at 5 min by addition of $10 \mu \mathrm{~L}$ of 4 X SDS gel loading dye to the $20 \mu \mathrm{~L}$ reactions. $12 \mu \mathrm{~L}$ samples were separated on a $4-15 \%$ Criterion TGX precast gel (Bio-Rad). Experiments were performed with an $n=2$ for compound 5 an $n=3$ for compound 16d.

Gels were dried, exposed to a storage phosphor screen overnight, and scanned using a Typhoon scanner. Bands corresponding to phosphorylated tubulin were quantified using ImageQuant, plotted as a function of log[inhibitor], and fit to the three-parameter $\log$ (inhibitor) vs. response model in GraphPad Prism 7.03 to determine the $\mathrm{IC}_{50}$., and mean and standard deviation values were calculated using the column statistics function of GraphPad Prism 7.03.

Standard control compounds are run during each assay to assess consistency across time, experimenters, and subtle changes in assay conditions that are sometimes required to keep some of the compounds soluble and disperse (such as through addition of DDM or 3\% DMSO). Paroxetine, GSK180736A, and CCG215022 were used as controls for compounds 4-9, and CCG215022 for compounds 16a-16j.

2,4-dichloro-7-tosyl-7H-pyrrolo[2,3-d]pyrimidine (S2): To a 100 mL round bottom flask was added 2,4-dichloro-7H-pyrrolo[2,3-d]pyrimidine $\mathbf{S 1}$ ( $1.0 \mathrm{~g}, 5.32 \mathrm{mmol}$ ), 4 - methylbenzene - 1 - sulfonyl
chloride ( $1.12 \mathrm{~g}, 5.85 \mathrm{mmol}$ ), tetra - butyl ammonium chloride ( $0.07 \mathrm{~g}, 0.27 \mathrm{mmol}$ ), and dichloromethane ( 20 mL ). Then 6 N sodium hydroxide ( $2.66 \mathrm{~mL}, 15.96 \mathrm{mmol}$ ) was added dropwise. The slurry was stirred at room temperature vigorously for 1.5 hours going from cloudy to clear. The reaction was then diluted with water and the layers were separated. The organic layer was washed with $\mathrm{NaCl}(1 x)$, and then dried with $\mathrm{MgSO}_{4}$. The $\mathrm{MgSO}_{4}$ was filtered off and the filtrate was then concentrated. The resulting off white solid was purified using $100 \%$ dichloromethane to give the title compound as a white solid ( $1.64 \mathrm{~g}, 4.79 \mathrm{mmol}, 89 \%$ yield). 1H NMR (500 MHz, DMSO-d6) ס 8.13 (d, J = $4.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 8.07 - 8.01 (m, 2H), 7.51 (d, J = 8.2 Hz , $2 \mathrm{H}), 6.99(\mathrm{~d}, \mathrm{~J}=4.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.39(\mathrm{~s}, 4 \mathrm{H})$. A flame dried flask was charged with 995.4 mg of 3 -amino-4-methoxybenzamide (18) ( 6 mmol , 1.0 equiv) and 30 mL of dry THF ( 0.1 molar). The solution was cooled to $0^{\circ} \mathrm{C}$ and 6.1 mL of LAH ( $10 \mathrm{mmol}, 2$ equiv) were added dropwise over 5 min . The bright yellow solution was allowed to continue stirring at $0^{\circ} \mathrm{C}$ for 30 min . After 30 min , the solution was warmed to $65^{\circ} \mathrm{C}$ for $6-8$ hours. Once complete, the reaction was cooled back to $0^{\circ} \mathrm{C}$ and worked up with the Feiser Method: 0.457 mL water, followed by 0.457 mL of freshly prepared $15 \% \mathrm{NaOH}$, and 1.371 mL of water. A flame dried flask was charged with 900.0 mg of 18 ( $5.91 \mathrm{mmol}, 1.0$ equiv) and 40 mL of dry THF ( 0.19 molar). The solution was cooled to $0{ }^{\circ} \mathrm{C}$ and 0.92 mL of TEA ( $6.6 \mathrm{mmol}, 1.1$ equiv), and 0.94 mL of $\mathrm{Cbz-Cl}(6.6 \mathrm{mmol}, 1.1$ equiv) were added in one portion, respectively. Once complete, the reaction was quenched with water and then extracted with EtOAc ( $3 \times 50 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( $1 \times 30 \mathrm{~mL}$ ) and then dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The crude oil was purified by column chromatography ( $0-100 \% \mathrm{EtOAc} / \mathrm{Hex}$ ) to give a light yellow oil, $1.14 \mathrm{~g}, 67.3 \%$. Figure S1. Intact protein MS of GRK5 incubated with 16b-e. (A) MS trace for hGRK5 shows the predicted weight of 68,882 Da. (B) MS trace GRK5 incubated with 16b, shows that only a small portion of compound labels GRK5. (C) MS trace for GRK5 incubated with 16c indicating no covalent interaction. (D) MS trace for GRK5 incubated with 16e indicating no covalent interaction. (E) MS trace for GRK5 incubated with 16d indicating that covalent interaction has taken place, with the predicted adduct appearing at 69,367 Da.

Figure S3. Tandem MS/MS table \& details for hGRK5 incubated with 16d. (A) Tandem $\mathrm{MS} / \mathrm{MS}$ table of proteins detected in the GRK5-16d sample, indicating that $85 \%$ of the peptides belong to GRK5. (B) GRK5•16d analysis table showing only the modification made to GRK5 by 16d. Our desired modification (denoted "Rowland") is observed at Cys474 with high confidence. Additional modification is observed at Cys54, which likely occurs via a non-selective mechanism. (C) Fragmentation of peptide labeled "Rowlands [C17]".

Figure S4. Structural rationalization of tandem MS/MS results. Wild-type GRK5 (blue ribbon diagram) shown with 16d (gold carbons) docked into active site. Cysteine sites of modification identified by tandem MS/MS are shown with sphere side chains (blue carbon,yellow sulfur). Cys54 is in a highly solvent exposed region, suggesting nonselective labelling. ${ }^{5}$

Figure S5. Time dependent inhibition of GRK5 by 5 and 16d using light activated ROS as substrate. Compounds were preincubated for times of 0 mins (solid circle), 30 min (solid square), 60 min (solid triangle) and 240 min (open square). Both compounds demonstrate the expected leftward shift in $\mathrm{IC}_{50}$ as preincubation time increase, similar to when tubulin is used as substrate (Figure 2). (A) $\mathrm{IC}_{50}$ values of 5 at each preincubation time: $\left[I C_{50}\right]_{0 \text { min }}>100 \mu \mathrm{M},\left[I C_{50}\right]_{30 \text { min }}=4.2 \pm 2 \mu \mathrm{M},\left[\mathrm{IC}_{50}\right]_{60 \text { min }}=3.4 \pm 2 \mu \mathrm{M}$ and $\left[I C_{50}\right]_{240 \mathrm{~min}}$ $=0.9 \pm 0.2 \mu \mathrm{M}$. (B) $\mathrm{IC}_{50}$ values of 16d at each preincubation time: $\left[\mathrm{IC}_{50}\right]_{0 \text { min }}=91 \pm 20 \mu \mathrm{M}$, $\left[I C_{50}\right]_{30 \text { min }}=12 \pm 3 \mu \mathrm{M},\left[\mathrm{IC}_{50}\right]_{60 \text { min }}=7.6 \pm 4 \mu \mathrm{M}$ and $\left[I C_{50}\right]_{240 \text { min }}=2.7 \pm 0.8 \mu \mathrm{M}$. Errors correspond to standard deviation from 2 (panel A) or 3 (panel B) replicates.
