General Methods All final compounds were synthesized at Gilead Sciences, Inc (Foster City, CA, USA and Branford, CT, USA). Commercial solvents and reagents were used as received without further purification. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Varian 400-MR ( 400 MHz ) or Varian Mercury Plus ( 300 MHz ) spectrometers in the specified deuterated solvent. Preparative normal phase chromatography was performed on a Yamazen W-Prep 2XY instrument using pre-packed UNIVERSAL silica gel columns. Alternatively, an ISCO Combiflash Companion purification system with RediSep Rf prepacked silica gel cartridges supplied by Teledyne Isco was also used for purification of intermediates and final compounds. Preparative reverse phase high-pressure liquid chromatography (HPLC) was performed on a Varian Prostar system using a Gemini C18 $110 \AA$ Å column ( $100 \times 30 \mathrm{~mm}, 5 \mu \mathrm{~m}$ ) at $21^{\circ} \mathrm{C}$, with a $20-98 \%$ gradient of acetonitrile and $0.1 \%$ hydrochloric acid in water, at a $20 \mathrm{~mL} / \mathrm{min}$ flow rate over 20 minutes with UV detection at 254 nm . LC/MS analysis was performed on an Agilent 1200 HPLC instrument in-line with an Agilent G6120A single quadrupole mass spectrometer (MS) equiped with an API electrospray source with positive mode ionization $\left([\mathrm{M}+\mathrm{H}]^{+}\right)$. The analytical method consisted of an Agilent Zorbax Eclipse XDB-C18 column ( $4.6 \times 20 \mathrm{~mm}, 3.5$ $\mu \mathrm{m}$ ), 2-95\% gradient of $0.1 \%$ trifluoroacetic acid in acetonitrile and $0.1 \%$ trifluoroacetic acid in water, at a $2.0 \mathrm{~mL} / \mathrm{min}$ flow rate over 3.5 minutes. For compounds synthesized outside Foster City, LC/MS analysis was performed on a Waters SQD (Model F085QD294W) with electrospray ionization in the positive mode. The analytical method consisted of an Acquity UPLC BEH C18 column ( $2.1 \times 50 \mathrm{~mm}, 1.7 \mu \mathrm{~m}$ ), 25-75\% gradient of $0.1 \%$ trifluoroacetic acid in acetonitrile and $0.1 \%$ trifluoroactic acid in water, at a $0.8 \mathrm{~mL} / \mathrm{min}$ flow rate over 1.75 minutes. High-resolution mass spectrometry (HRMS) was performed on an Agilent Infinity II 1290 HPLC system in-line with a Thermo Electron Orbitrap Elite instrument (positive mode, scan range 2501000 mass units). Chromatography was performed on a Waters Acquity UPLC BEH C18 $130 \AA$ column $(2.1 \times 100 \mathrm{~mm}, 1.7 \mu \mathrm{~m})$ at $40{ }^{\circ} \mathrm{C}$, with a $5-90 \%$ gradient of $0.1 \%$ formic acid in acetonitrile and $0.1 \%$ formic acid in water, at a $0.8 \mathrm{~mL} / \mathrm{min}$ flow rate over 8.5 minutes with UV detection at $190-400 \mathrm{~nm}$. Purities of the final compounds were determined using an Agilent Infinity II 1290 HPLC system, a Phenomenex Kinetex C18 100 Å column ( $4.6 \times 100 \mathrm{~mm}, 2.8$ $\mu \mathrm{m})$ at room temperature, with a $2-98 \%$ gradient of $0.1 \%$ trifluoroacetic acid in acetonitrile and $0.1 \%$ trifluoroacetic acid in water, at a $1.5 \mathrm{~mL} / \mathrm{min}$ flow rate over 8.5 minutes with UV detection at 254 nm . All final compounds were lyophilized.

## Crystallography

MTH1 protein expression and purification pet28a-6HIS-MTH1 was generated by ligating human MTH1 between the Nde1 and Xho1 sites of pet28a to generate MTH1 preceded by a HIS tag and a thrombin cleavage site. 6HIS-MTH1 was expressed in BL21(DE3) cells (New England Biolabs). Cells were grown in LB media at 37 oC and expression was induced with 0.5 mM IPTG for 12 h at 18 C . Cells were lysed in Buffer A ( 50 mM TRIS pH 7.5, $500 \mathrm{mM} \mathrm{NaCl}, 2$ mM TCEP, $5 \%$ Glycerol, 5 mM Imidazole pH 7.5 ) and centrifuged at 47000 xg for 45 minutes. The supernatant, containing soluble 6HIS-MTH1, was applied to a $5 \mathrm{ml} \mathrm{Ni}-\mathrm{NTA}$ equilibrated in Buffer A. The column was washed with Buffer A supplemented with 20 mM Imidazole and eluted with Buffer A supplemented with 300 mM Imidazole. Fractions containing 6HIS-MTH1 were incubated with thrombin ( $2 \mathrm{U} / \mathrm{mg}$ 6HIS MTH1) and the cleaved MTH1 protein was further purified by size exclusion chromatography in Buffer B ( 20 mM TRIS pH 7.5, $150 \mathrm{mM} \mathrm{NaCl}, 2$ mM TCEP, $5 \%$ Glycerol). Protein was judged $>95 \%$ pure by SDS-PAGE and was concentrated to $8 \mathrm{mg} / \mathrm{ml}$ in a final buffer solution contained 20 mM Tris $\mathrm{pH} 7.5,150 \mathrm{mM} \mathrm{NaCl}, 5 \%$ glycerol, 2 mM TCEP.

Crystallization and data collection Co-crystals of the MTH1 complex with inhibitors were grown at $20^{\circ} \mathrm{C}$ by vapor diffusion over a reservoir solution containing $30 \%$ PEG $6000,0.1 \mathrm{M}$ sodium acetate $\mathrm{pH} 4.0,0.2 \mathrm{M}$ lithium sulfate. Protein and reservoir solutions were mixed at $1: 1$ or $1: 2$ ratios for a final volume of $2-3 \mu \mathrm{~L}$. Prior to cryocooling in liquid nitrogen, $20 \%$ glycerol was added in addition to the mother liquor components. X-ray diffraction data were collected on a Rigaku MM007 rotating anode or at The Advanced Light Source beamline 5.0.1 (Table S1) at a temperature of 100 K and processed with HKL2000 ${ }^{1}$.

Structure determination and refinement The structures of MTH1 were determined by molecular replacement with the refinement package Phenix ${ }^{2}$ using the starting model PDB code 3ZR0. Rigid body refinement, simulated annealing, energy minimization, and B-factor refinement were additionally performed with Phenix. Model building was carried out by the molecular graphics program Coot ${ }^{3}$.

MTH1 Biochemical Assay Activity of the MTH1 enzyme was assessed by detecting the inorganic pyrophosphate generated when the nucleoside triphosphate substrate, 8-oxo-dGTP, is hydrolysed. All concentrations are final unless noted otherwise. The compounds were serial diluted from a 10 mM DMSO stock and all reactions contained a final concentration of $1 \%$ DMSO. The general reaction buffer contained 100 mM Tris $\mathrm{HCl}(\mathrm{pH} 7.5), 40 \mathrm{mM} \mathrm{NaCl}, 10 \mathrm{mM}$ $\operatorname{Mg}(\mathrm{OAc})_{2}, 2 \mathrm{mM}$ DTT, $0.005 \%$ Tween 20 , and $0.01 \%$ BSA. The testing compounds were preincubated with 0.3 nM full-length recombinant MTH1 for 30 minutes at room temperature (RT) in the reaction buffer. The reaction was initiated by the addition of substrate at $2 \mathrm{x} K_{m}$ (final concentration of $20 \mu \mathrm{M}$ for 8 -oxo-dGTP and $10 \mu \mathrm{M}$ for $2-\mathrm{OH}-\mathrm{dATP}$ ), followed immediately by the addition of $2 \mathrm{X} \mathrm{PPiLight}{ }^{\mathrm{TM}}$ inorganic pyrophosphate kit (Lonza, Basel, Switzerland) for phosphate detection. The reaction was incubated for 3 hours at RT before the luminescence signal was measured on an Envision plate reader (Perkin Elmer, Waltham MA). Data analysis was completed using Prism (v7.0, GraphPad, La Jolla, CA). The $K_{\mathrm{i}}$ value for 5 was measured under conditions similar to the ones described above, however 0.05 nM MTH1 and $20 \mu \mathrm{M} \mathrm{8-}$ oxo-dGTP ( $2 \times K_{\mathrm{m}}$ ) were used. The reaction was incubated for 1 hour and the linear portion of
the reaction was used to derive the rates of product formation. The apparent $K_{\mathrm{i}}, K_{\mathrm{i}(\mathrm{app})}$, was calculated using Morrison tight-binding equation with DynaFit software. The $K_{\mathrm{i}}$ value was then calculated from $K_{\mathrm{i}(\text { app })}$ using equation $K_{\mathrm{i}(\text { app })}=K_{\mathrm{i}}\left(1+[\mathrm{S}] / K_{\mathrm{m}}\right)=3 K_{\mathrm{i}}$, based on the specific assay conditions. For 5, the $K_{i(a p p)}$ value was determined to be $5.2 \pm 0.9 \mathrm{pM}$ with $95 \%$ confidence interval of $3.4-7.3 \mathrm{pM}$, and the $K_{i}$ value was determined to be 1.7 pM with $95 \%$ confidence interval of 1.1-2.4 pM.

${ }^{a}$ For compound 5, the $\mathrm{IC}_{50}$ was determined using 50 pM of MTH1 enzyme.

Cell Viability Assay U2OS cells were seeded in a 96 -well tissue culture plate at a density of 2000 cells/well in $100 \mu \mathrm{~L}$ DMEM supplemented with $10 \% \mathrm{FBS}, 100 \mathrm{U} / \mathrm{mL}$ penicillin and $100 \mathrm{mg} / \mathrm{mL}$ streptomycin (Gibco, Life Technologies, Carlsbad, CA) and treated in triplicate with
a titration of compounds for 72 h in a humidified atmosphere of $5 \% \mathrm{CO}_{2}, 95 \%$ air at $37{ }^{\circ} \mathrm{C}$. Viability was assessed using CellTiter-Glo Luminescent Cell Viability Assay (Promega Corp., Madison, WI) and read on a Synergy 4 plate reader (BioTek, Winooski, VT). Data was plotted as percent vehicle (DMSO) control.
p53 Pathway Activation in U2OS Cells using Peggy Sue ${ }^{\text {TM }}$ Simple Western U2OS cells were grown overnight in DMEM medium supplemented with $10 \% \mathrm{FBS}$ and treated the following morning with $1 \mu \mathrm{~g} / \mathrm{ml}$ mitoxantrone, $5 \mu \mathrm{M}$ TH287, $5 \mu \mathrm{M}$ TH588 or $5 \mu \mathrm{M} 5$ for 4 h or 24 h . Cells were harvested in lysis buffer (Cell Signaling Technology) containing: Protease Inhibitor Cocktail (Roche Diagnostics Corp), and phosphatase inhibitor sets 1 and 2 (EMD Millipore). Following 10 minutes on ice, cell lysates were cleared by centrifugation at 12,500 rpm for 10 minutes at $4^{\circ} \mathrm{C}$. Lysates were analyzed by Simple Western using Peggy Sue ${ }^{\mathrm{TM}}$ (ProteinSimple, San Jose, CA; referred to in the text as Simple Western). Data was processed using Compass software (ProteinSimple). The following antibodies were purchased from Cell Signaling Technology (Danvers, MA): p-p53 (S15) (\#9286 mouse monoclonal), actin (\#4967 rabbit polyclonal).

Figure S3. Expression of p-p53 and $\beta$-actin in U2OS cells treated with TH588, SCH51344, Compound 32 and Compound 5 at $5 \mu \mathrm{M}$ and mitoxantrone at $2.25 \mu \mathrm{M}$, measured using Peggy Sue ${ }^{\mathrm{TM}}$ Western blot.

Immunostaining U2OS cells were cultured in 8-well slide (MilliporeSigma, Millicell EZ Slides, Cat\#PEZGS0816), treated with inhibitors and fixed in ice-cold methanol following by washing in Dulbecco's Phosphate-Buffered Salt Solution (DPBS) (Corning) and blocking in DPBS with $10 \%$ HyClone Fetal Bovine Serum (FBS) (MilliporeSigma) and 0.1\% Triton X-100 (MilliporeSigma) for 80 minutes. Anti-phospho-histone H2AX (Ser139) mouse monoclonal antibody (MilliporeSigma, 05-636-I, clone JBW301) was applied at concentration of $2.5 \mu \mathrm{~g} / \mathrm{mL}$ in DPBS containing $1 \%$ FBS. Donkey polyclonal anti-mouse IgG (H+L) antibody conjugated with Alexa Fluor 488 (ThermoFisher Scientific A21202, $2 \mu \mathrm{~g} / \mathrm{mL}$ ) was used as the secondary antibody. The coverslips with stained cells were mounted on the glass microscopic slides (VWR International, Radnor, PA) with a drop of mounting medium Vectashield H-1300 (Vector Laboratories, Burlingame, CA) containing DNA dye propidium iodide.

Confocal imaging The samples were imaged with confocal laser scanning microscope LSM 5 PASCAL (Carl Zeiss, Germany) equipped with a Zeiss Plan-Apochromat oil immersion objective (40x magnification, 1.4 numerical aperture). The fluorophores were excited at 488 nm (Alexa Fluor 488) and 633 nm (propidium iodide). The fluorescence was detected using bandpass filter 505-600 nm for Alexa Fluor 488 and long-pass filter $>650 \mathrm{~nm}$ for propidium iodide. The images were analyzed by manual counting of the phospho-Histone H2A.X ( $\gamma \mathrm{H} 2 \mathrm{~A} . \mathrm{X}$ )positive foci in individual nuclei.

## Intracellular endogenous nucleotide concentration measurement in U2OS cells

MTH1 shRNA Knockdown Lentiviral transduction particles containing Mission shMTH1.GFP and shControl.GFP constructs (Millipore Sigma) were obtained to induce MTH1 knockdown: shMTH1-2 (TRCN0000288947): 5, CCTGAGCTCATGGACGTGCAT 3' shMTH1-3 (TRCN0000050132): 5' CGAGTTCTCCTGGGCATGAAA 3' as previously described (Patel, A., MTH1 Oncogene 2015). U20S and SW480 cell lines, purchased from the American Type Culture Collection (Manassas, VA), were transduced and then selected in geneticin containing media ( $10 \%$ FBS, $100 \mathrm{U} / \mathrm{mL}$ penicillin and $100 \mathrm{ug} / \mathrm{mL}$ streptomycin (Gibco, Life Technologies, Carlsbad, CA)). Geneticin selected tumor cells were then sorted for GFP+ expression by fluorescence activated cell sorting and analyzed for MTH1 expression.

Cells Cells were cultured in T175 Vented Flask (Corning, Kennebunk, ME) in Dulbecco's Modified Eagle Medium (DMEM; Sigma) with 10\% fetal bovine serum (FBS; Sigma-Aldrich, St. Louis, MO) $+/-400 \mu \mathrm{~g} / \mathrm{mL}$ G418 to maintain the selection. Approximately 10 million cells were cultured in each T175 flasks. At 48 hours post-incubation of MTH1 inhibitor 37, extracellular media was removed, cells were trypsinized (Sigma-Aldrich) and combined into 15 mL conical tube, and then washed twice with 4 mL of ice-cold $0.9 \%$ normal saline. The cell pellets were quenched with 1 mL ice-cold $70 \%$ methanol containing 500 nM 2 -chloro-adenosine-5'-triphosphate (Sigma-Aldrich) as an internal standard. Samples were stored overnight at $-20^{\circ} \mathrm{C}$ to facilitate nucleotide extraction, centrifuged at $15,000 \times g$ for 15 minutes and then supernatant was transferred to clean tubes for drying in a MiVac Duo concentrator (Genevac, Gardiner, NY). Dried samples were then combined and reconstituted in 1 mM ammonium phosphate buffer ( pH 7.4) for analysis by LC-MS/MS.

LC-MS/MS Instrumentation Cell lysates were analyzed using a HTS PAL autosampler with cooled sample storage stacks set at $10^{\circ} \mathrm{C}$ (Leap Technologies, Carrboro, NC) and an LC-20AD ternary pump system (Shimadzu Scientific Instruments, Columbia, MD). HPLC system was coupled to a Sciex API-5000 mass spectrometer (Applied Biosystems, Foster City, CA). Mass spectrometry was performed in positive-ion mode and using a multiple reaction monitoring mode (MRM). The standard stock solution of each analytes, 8-oxo-dGTP was purchased from TriLink Biotechnologies (San Diego, CA), 8-oxo-rGTP was purchased from Jena Biosciences (Jena, Germany), and dGTP and rGTP were purchased from Sigma-Aldrich. Analytes were separated using a $50 \times 2 \mathrm{~mm} \times 2.5 \mu$ Luna C18(2) HST column (Phenomenex, Torrance, CA). A multistage linear gradient from $10 \%$ (Mobile Phase A) to $50 \%$ acetonitrile (Mobile Phase B) in a mobile phase containing 3 mM ammonium formate ( pH 5.0 ) with 10 mM dimethylhexylamine at a flow rate of $0.15 \mathrm{~mL} / \mathrm{min}$ was used to elute the analytes. Analytes were quantified using a 7 point standard curve prepared in cell extract from untreated cells.
