## I . General information

All reagents were obtained from commercial suppliers and used without further purification. Yields for all compounds were determined by the column chromatography which was generally performed on silica gel (200-300 mesh) using petroleum ether 40-60 (PE)/EtOAc as eluent, and reactions were monitored by thin layer chromatography (TLC) on a glass pate coated with silica gel with fluorescent indicator (GF254) using UV light. The ${ }^{1} \mathrm{H}$ reree and ${ }^{13} \mathrm{C}$ nuclear magnetic resonance (NMR) spectra were recorded on a Bruker ADNANCE III 500 MHz using $\mathrm{CDCl}_{3}$ as solvent with TMS as internal standard. Chemical shifts are given in ppm ( $\delta$ ) referenced to $\mathrm{CDCl}_{3}$ with 7.28 for ${ }^{1} \mathrm{H}$ and 77.03 for ${ }^{13} \mathrm{C}$, and to DMSO- $d_{6}$ with 2.50 for ${ }^{1} \mathrm{H}$ and 39.52 for ${ }^{13} \mathrm{C}$. Signals are abbreviated as follows: $s$, singlet; d , doublet; t , triplet; q , quartet; m , multiplet, and coupling constants are expressed in hertz. Melting points were measured on a $\mathrm{SGW}_{\circledR} \mathrm{X}-4 \mathrm{~B}$ apparatus and uncorrected. HRMS were recorded on Agilent 6210TOF LC/MS mass spectrometer.

The reaction tube was sealed and stirred at $145{ }^{\circ} \mathrm{C}$ (pre-heated oil bath) for 12 h . The reaction mixture was then cooled to r.t. and diluted with water ( 10 mL ) before it was extracted with EtOAc ( $15 \mathrm{~mL} \times 3$ ). The combined organic phase was washed with water ( $10 \mathrm{~mL} x \mathrm{3}$ ) and saturated brine ( 10 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was purified by column chromatography (PE/EA $=500: 1$ ) on silica gel to provide the desired indolo [1,2-f]phenanthridine 3aa ( $75.4 \mathrm{mg}, 94 \%$ ) as a white solid.
