## 1. General

Nuclear magnetic resonance $\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C}\right)$ spectra were recorded on a Bruker Avance 300 instrument $\left({ }^{1} \mathrm{H}\right.$ : $300.13 \mathrm{MHz},{ }^{13} \mathrm{C}: 75.46 \mathrm{MHz}$ ) at ambient temperature. Chemical shifts ( $\delta$ ) are reported in parts per million ( ppm ) relative to tetramethylsilane (TMS) or solvent residual signals. The following abbreviations were used for chemical shift multiplicities in ${ }^{1} \mathrm{H}$ NMR spectra: $\mathrm{br}=$ broad, $\mathrm{s}=$ singlet, d $=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, sept $=$ septet, $\mathrm{m}=$ multiplet. IR spectra were recorded on a Shimadzu IR Affinity-1 FT-IR spectrometer. GC-MS analyses were done on a Hewlett Packard HP 6890 Series Plus gas chromatograph, injector and autosampler, HP 5973 Series mass-selective detector operated in electron-impact (EI) mode with an ionization energy of 75 eV and all other parameters set at autotune values, using $\mathrm{H}_{2}$ as carrier gas and a HP-5 MS column ( 30 mx 0.25 mm ID, $0.25 \mu \mathrm{~m}$ film thickness): temperature program (Std 50): $50^{\circ} \mathrm{C}, 5 \mathrm{~min} ; 20^{\circ} \mathrm{C} / \mathrm{min}$ to $280^{\circ} \mathrm{C}, 280^{\circ} \mathrm{C}, 10 \mathrm{~min}$, unless otherwise stated. ESI-mass spectra were measured on an Agilent 1100 Series LC/MSD instrument with a G1312A binary pump, G1313A autosampler and G1956A mass-selective detector. GC analyses were done on an Agilent 6890N Network gas chromatograph, injector and autosampler, and flame ionization detector, using $\mathrm{N}_{2}$ as carrier gas. Elemental analyses were performed using an Elementar Vario EL elemental analyzer. Optical rotations were recorded on an Anton Paar MCP 200 polarimeter. Melting points were determined on a Büchi apparatus and are uncorrected.
$(S)-(-)-\beta$-Citronellol (Merck), (R)-(+)- $\beta$-citronellol (Sigma Aldrich), 2,4,6-trimethylaniline (Alfa Aesar), 2,6-diisopropylaniline (Alfa Aesar), 2,6-dimethylaniline (Sigma Aldrich), 2,6-diethylaniline (Sigma Aldrich), fuming nitric acid ( $90 \%$, Acros), 3-nitrophenylhydrazine hydrochloride (TCI), triethyl orthoformate (Acros), chlorobenzene (Acros), and HCl in dioxane (ca. $4 \mathrm{M}, \mathrm{TCI}$ ) were purchased from the suppliers indicated and used as received. Diisopropyl ethyl amine (DIPEA) was distilled over $\mathrm{CaH}_{2}$ under Ar. Anhydrous THF and MeCN were dried over $\mathrm{Na} /$ benzophenone and $\mathrm{CaH}_{2}$, respectively, and distilled under Ar.

### 2.1 General procedure 1 (GP-1) for the nitration of anilines to give 9: ${ }^{1}$

In a three-necked round-bottom flask, a solution of aniline $\mathbf{8}\left(150 \mathrm{mmol}, 1.0\right.$ equiv) in conc. $\mathrm{H}_{2} \mathrm{SO}_{4}$ $(100 \mathrm{~mL})$ was cooled in an ice-salt bath. Fuming nitric acid ( $90 \%, d=1.5,1.0$ or 2.0 equiv) was slowly added dropwise, the internal temperature was controlled not to exceed $10{ }^{\circ} \mathrm{C}$. After the addition was complete, stirring of the reaction mixture was continued in the ice bath for 1 h . The mixture was then poured into ice (ca. 500 mL ) and cooled down in an ice-water bath. The mixture was made slightly basic by slow addition of $\mathrm{NaOH}(6 \mathrm{~N})$, keeping the temperature below $25^{\circ} \mathrm{C}$. The resulting

### 2.2 General procedure 2 (GP-2) for the synthesis of hydrazines 10 from 9:

In a three-necked round-bottom flask equipped with an overhead stirrer, a suspension of aniline 9 ( 1.0 equiv) in conc. HCl (ca. $2 \mathrm{~mL} / \mathrm{mmol}$ ) was cooled in an ice-salt bath. A solution of $\mathrm{NaNO}_{2}$ ( 1.1 equiv) in water (ca. $0.18 \mathrm{~mL} / \mathrm{mmol}$ ) was added dropwise, keeping the internal reaction temperature below $5{ }^{\circ} \mathrm{C}$. After the addition was complete, stirring of the reaction mixture was continued in the ice bath for 30 min . A solution of $\mathrm{SnCl}_{2} \bullet 2 \mathrm{H}_{2} \mathrm{O}$ ( 2.5 equiv) in conc. HCl (ca. $0.25 \mathrm{~mL} / \mathrm{mmol}$ ) was added dropwise such that the temperature stayed below $5^{\circ} \mathrm{C}$. After completion of the addition, stirring of the reaction mixture was continued at $0^{\circ} \mathrm{C}$ for 1 h and then at rt for 24 h . The precipitate was collected by suction filtration, and washed with 4 N HCl (Important note: the product is soluble in water!) and then with $\mathrm{Et}_{2} \mathrm{O}$, providing the hydrazine hydrochloride $\mathbf{1 0} \cdot \mathrm{HCl}$, which can be used in the next step without further purification.

To obtain the free hydrazine $\mathbf{1 0}$, a suspension of the hydrochloride salt $\mathbf{1 0} \bullet \mathrm{HCl}$ in water (ca. 1 $\mathrm{mL} / \mathrm{mmol}$ ) was treated with cold $10 \% \mathrm{NaOH}$ (aq.) at $0^{\circ} \mathrm{C}$ until slightly basic. After stirring at $0^{\circ} \mathrm{C}$ for 1 h , the solid was collected by suction filtration and washed with water and $\mathrm{Et}_{2} \mathrm{O}$ to give the free hydrazine 10, which was used in the next step without further purification. The product should be stored at temperature below $4{ }^{\circ} \mathrm{C}$.

### 3.2 General procedure 3 (GP-3) for the three-step synthesis of triazolium salts

The benzamide 11 ( 1.0 equiv) was refluxed in $\mathrm{SOCl}_{2}$ (excess) for 2 h . The excess of $\mathrm{SOCl}_{2}$ was distilled off in vacuo and colleccted in a trap cooled with liquid nitrogen. The residue was further dried in high vacuum to give the corresponding benzimidoyl chloride, which was used in the next step without further purification. The imidoyl chlorides $\mathbf{1 1 a} \mathbf{- C l}$ and $\mathbf{1 1 b} \mathbf{- C l}$ were also prepared on large scale and stored below $4^{\circ} \mathrm{C}$ for use in the next step.

The hydrazine $\mathbf{1 0}$ ( 1.0 equiv) or $\mathbf{1 0} \bullet \mathrm{HCl}$ ( 1.2 equiv) and dry THF were added to the benzimidoyl chloride ( 1.0 eqiuv) under Ar atmosphere. The mixture was cooled in an ice bath, followed by the addition of $N$-methylmorpholine (NMM, 1.1-1.8 equiv). The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 30 min and then at rt for 24 h . The volatiles were removed on a rotary evaporator. The residue was diluted with water and extracted with DCM. The combined organic layers were washed with water, brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the solvent, the crude product $\mathbf{1 2}$ was directly subjected to the final ring closing step.

To the crude 12, in a round-bottom flask, was successively added chlorobenzene, triethyl orthoformate, and anhydrous HCl ( 4 M in dioxane, 1-2 equiv). The reaction flask was immersed in an oil bath at $110^{\circ} \mathrm{C}$, and the mixture was stirred open to air for $1-16 \mathrm{~h}$. The reaction mixture was then concentrated on a rotary evaporator at $60^{\circ} \mathrm{C}$. The residue was washed with $\mathrm{Et}_{2} \mathrm{O}$ by vigorously stirring for 1 h and the $\mathrm{Et}_{2} \mathrm{O}$ phase was removed. The residue was further triturated with EtOAc with vigorous stirring for at least 2 h . The resulting solid was collected by suction filtration and washed with EtOAc (trituration with EtOAc can be repeated several times), furnishing the desired triazolium salt (13-19).

## 4. Synthesis of 8-oxocitronellal (5) from citronellol

For the synthesis of 5, a modification of a procedure described by Hofferberth and co-workers was employed. ${ }^{4}(S)$-Citronellol ( $10 \mathrm{~g}, 64.0 \mathrm{mmol}, 1.0$ equiv) was added to a mixture of $\mathrm{SeO}_{2}(0.36 \mathrm{~g}$,

[^2]$3.3 \mathrm{mmol}, 5 \mathrm{~mol} \%$ ), salicylic acid ( $0.92 \mathrm{~g}, 6.7 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ), $t$ - $\mathrm{BuOOH}\left(70 \%\right.$ in $\mathrm{H}_{2} \mathrm{O}, d=0.94,30$ $\mathrm{mL}, 219 \mathrm{mmol}, 3.4$ equiv), and $\mathrm{DCM}(20 \mathrm{~mL})$. The reaction mixture was stirred at rt for 3 d , diluted with toluene $(50 \mathrm{~mL})$ and evaporated on a rotary evaporator. The residue was diluted with $\mathrm{Et}_{2} \mathrm{O}(200$ mL ), washed with $10 \% \mathrm{NaOH}(6 \times 25 \mathrm{~mL})$ and brine, dried over anhyd $\mathrm{MgSO}_{4}$, and filtered. After removal of the solvent, the resulting pale yellow oil ( 10.8 g ), containing a mixture of ( $S$ ) $\mathbf{- 6}$ and ( $S$ )-7, was purified by passing it though a short pad of silica gel. First, by eluting with $\mathrm{EtOAc} / \mathrm{cHex}, 1: 4$, less polar impurities of $R_{\mathrm{f}} \mathrm{ca}$. 0.6 ( $\mathrm{EtOAc} / \mathrm{Hex}, 1: 1$ ) were removed. Then, using EtOAc/cHex, 3:1 as eluent, a mixture of $(S)-6$ and $(S)-7$ was obtained $\left[R_{\mathrm{f}}=0.32\right.$ and $0.13(E t O A c / H e x, 1: 1), 7.7 \mathrm{~g}, 45.0 \mathrm{mmol}$, 70\%].

To this mixture of ( $S$ )-6 and ( $S$ )-7 ( $45.0 \mathrm{mmol}, 1.0$ equiv) in dry $\mathrm{MeCN}(100 \mathrm{~mL}$ ) was added IBX $\left(22.0 \mathrm{~g}, 78.6 \mathrm{mmol}, 1.8\right.$ equiv). The suspension was stirred at $60^{\circ} \mathrm{C}$ for 3 h , cooled down to rt , and

(S)-5 diluted with EtOAc ( 100 mL ). The solid was filtered off with a glass frit and washed with EtOAc, affording IBA which can be oxidized to IBX in $86 \%$ yield with Oxone, following the procedure described by Santagostino and co-workers. ${ }^{5}$ The filtrate was concentrated on a rotary evaporator and purified by column chromatography on silica (EtOAc/cHex, 1:9) to give ( $S$ ) - $\mathbf{5}(6.2 \mathrm{~g}$, $36.9 \mathrm{mmol}, 58 \%)$ as a pale yellow oil: $R_{\mathrm{f}}=0.63(\mathrm{EtOAc} / \mathrm{Hex}, 1: 1) ;{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=$ $9.78(\mathrm{t}, J=2.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CHO}), 9.40(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CHO}), 6.48(\mathrm{td}, J=7.3,1.3 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}=\mathrm{CH}), 2.40(\mathrm{~m}, 4 \mathrm{H}$, $2 \mathrm{xCH}_{2}$ ), $2.14(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}), 1.75(\mathrm{~s}, 3 \mathrm{H}), 1.63-1.36\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.03\left(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=202.1(\mathrm{CHO}), 195.1(\mathrm{CHO}), 153.8(\mathrm{CH}), 50.8\left(\mathrm{CH}_{2}\right), 35.2\left(\mathrm{CH}_{2}\right), 27.7$ $(\mathrm{CH}), 26.4\left(\mathrm{CH}_{2}\right), 19.6\left(\mathrm{CH}_{3}\right), 9.2\left(\mathrm{CH}_{3}\right)$; IR (ATR): $\tilde{v}\left[\mathrm{~cm}^{-1}\right]=2959(\mathrm{~m}), 2922(\mathrm{~m}), 2716(\mathrm{w}), 1721$ (m), 1682 (s), 1643 (m), 1406 (m), 1381 (m), 1242 (m), 1067 (m), 1005 (m), 868 (w), 816 (w); GCMS: $t_{\mathrm{R}}(\operatorname{Std} 50)=11.0 \mathrm{~min}, m / z=168\left(\mathrm{M}^{+}, \operatorname{trace}\right), 139(100 \%), 124,109,97,79,69,55$.

$\xrightarrow[\begin{array}{l}\text { rt } 24 \text { h } \\ \text { open to air }\end{array}]{\substack{\mathrm{KOH} / \mathrm{H}_{2} \mathrm{O}}}$

For the recycling of $\mathbf{A}-\mathrm{H}_{2}$ to $\mathbf{A}$, a modification of the literature known synthesis of $\mathbf{A}$ from 2,6-di-tert-butylphenol was applied. ${ }^{7}$ A 250 mL Erlenmeyer flask was charged with $\mathbf{A}-\mathrm{H}_{2} / \mathbf{A}(13.5 \mathrm{~g}, 32.9$ mmol, 1.0 equiv, recovered from the oxidative NHC-catalyzed transformation of $\mathbf{5}$ to $\mathbf{1}$ ), $t$ - BuOH ( 120 mL ) and an aqueous solution of $\mathrm{KOH}\left(6.5 \mathrm{~g}, 115.9 \mathrm{mmol}, 3.5\right.$ equiv) in $\mathrm{H}_{2} \mathrm{O}(15 \mathrm{~mL})$. The brownyellow suspension was stirred vigorously open to air at rt for 24 h , resulting in a red-brown suspension. $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL})$ was added and stirring of the mixture was continued for 10 min . The solid was collected by suction filtration and washed with water to give the product as a red-brown powder $(12.9 \mathrm{~g}, 96 \%)$. Further purification by recrystallization from toluene/EtOH (1:2) furnished $\mathbf{A}(12.1 \mathrm{~g}$, $29.6 \mathrm{mmol}, 90 \%$ ) as red-brown crystals with a purple reflex; $97 \%$ purity, contaminated with $3 \% \mathbf{A}-\mathrm{H}_{2}$

## 6. HPL chromatograms for the determination of the enantiomeric composition of citronellol

The enantiomeric composition of citronellol was determined from the corresponding benzoyl ester. A small vial was charged with citronellol ( $23.4 \mathrm{mg}, 0.15 \mathrm{mmol}, 1.0$ equiv) and pyridine ( $20.0 \mu \mathrm{~L}, 0.25$ mmol, 1.7 equiv). Benzoyl chloride ( $20.0 \mu \mathrm{~L}, 0.17 \mathrm{mmol}, 1.1$ equiv) was added and the resulting white suspension was stirred at rt for 30 min . The reaction was quenched by adding 1 N HCl and diluted with hexanes. Aliquots of the organic phase were withdrawn, filtered through a plug of silica gel and washed with hexanes for HPLC analysis. The NMR data of the analyzed 3,7-dimethyloct-6-en-1-yl benzoate were identical to the literature. ${ }^{8}$

HPL chromatograms were acquired on a VWR Hitachi Chromaster HPLC equipped with Chiracel OD-H column. Conditions: solvent, $0.5 \%$ 2-propanol in hexanes; flow rate, $0.5 \mathrm{~mL} / \mathrm{min}$; oven temp, $18.0^{\circ} \mathrm{C}$; detector, UV @ 230 nm ; $t_{\mathrm{R}}$ of $(R)$-enantiomer $=11.6 \mathrm{~min}$ and $t_{\mathrm{R}}$ of $(S)$-enantiomer $=12.4$ min.
(S)-3,7-dimethyloct-6-en-1-yl benzoate derived from ( $S$ )-citronellol was $97 \%$ ee.
$(R)$-3,7-dimethyloct-6-en-1-yl benzoate derived from $(R)$-citronellol was $>99 \%$ ee.
