## Table of Contents

1. Supplementary UV-vis/ spectra of $\mathrm{Ru}(\mathrm{CO})(\mathrm{CO})^{2+}$ monitoring its reactivity with TEOA and Hydroxide .2
2. Supplementary IR spectra of $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ monitoring its reactivity with TEOA........ 3
3. Supplementary crystallographic data for $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ and $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}-\mathrm{TEOA}\right)^{2+}$
$\qquad$
4. Determination of equilibrium constant for the Zwitterionic capture of $\mathrm{CO}_{2}$.7
5. Supplementary cyclic voltammograms of $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ and $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+} \ldots . . . . . . .9$
6. Na-Hg Reduction ............................................................................................................... 11
7. Supplementary charge recombination kinetics from the singly-reduced $\mathrm{Ru}(\mathrm{CO})(\mathrm{X})^{(\mathrm{n}-1)^{+}}$
complexes to $\mathrm{BIH}^{+}$, in the absence of TEOA. ............................................................. 13
8. Supplementary TRIR data for $\mathrm{Ru}(\mathrm{CO})(\mathrm{CO}-\mathrm{TEOA})^{+}, \mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$and $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+} . .16$
9. Hydricity determination and thermodynamic relationships used for the calculation of hydricity and $\mathrm{pK}_{\mathrm{a}}$ of the metal hydrides in acetonitrile solutions19
10. Thermodynamic relationships for the determination of the $\mathrm{pK}_{\mathrm{a}}$ of $\mathrm{BIH}^{+}$. .......................... 26
11. Supplementary DFT data................................................................................................... 27
12. Supplementary $U V$-vis/ spectra of $\mathrm{Ru}(\mathrm{CO})(\mathrm{CO})^{2+}$ monitoring its reactivity with $T E O A$ and Hydroxide

Figure S1. UV-vis spectral changes of $\mathrm{Ru}(\mathrm{CO})(\mathrm{CO})^{2+}$ in acetonitrile solution upon titration of known concentrations of a) triethanolamine (TEOA) and b) TBAOH. Equilibrium constants were determined at the concentration of the respective added Lewis base when equal amounts of $\mathrm{Ru}(\mathrm{CO})(\mathrm{CO})^{2+}$ and $\mathrm{Ru}(\mathrm{CO})(\mathrm{CO}-\mathrm{TEOA})^{+}$, or $\mathrm{Ru}(\mathrm{CO})(\mathrm{COOH})^{+}$, existed. Note that in the case of the TEOA reaction, it is the deprotonated form of TEOA that binds to the complex.
2. Supplementary IR spectra of $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ monitoring its reactivity with TEOA

Figure S2. a) Mid-infrared absorption changes of the $v(\mathrm{CO})$ vibration of $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ monitored in $1.4 \mathrm{M} \mathrm{TEOA} / \mathrm{CH}_{3} \mathrm{CN}$ solution. b) Scheme depicting the reactivity of TEOA towards the $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ complex.

## 3. Supplementary crystallographic data for $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ and $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}-\mathrm{TEOA}\right)^{2+}$

Determination and Refinement of the Structure. The structures were solved by using direct methods. In the least-squares refinement, anisotropic temperature parameters were used for all the non-hydrogen atoms except for the disordered acetone molecule in $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]\left(\mathrm{PF}_{6}\right)_{2}$ with occupancy factor of 0.3 . The hydrogen atoms on the acetone molecule were not included in the final refinement. Hydrogen atoms were placed at calculated positions and allowed to "ride" on the atom to which they were attached except for the hydrogen atoms on the oxygen atoms of triethanolamine which were located on a difference Fourier map and included with fixed positional parameters. The isotropic thermal parameters for the hydrogen atoms were determined from the atom to which they are attached. The data were corrected for absorption using the multi-scan method (SADABS).
$\left.\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]\left(\mathrm{PF}_{6}\right)_{2}$ consists of a $\mathrm{Ru}(\mathrm{II})$ center coordinated to two 4,4'-dimethyl-2,2'-bipyridyl ligands cis to one another and a carbonyl ligand with the acetonitrile ligand occupying the sixth coordination position. In $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left\{\mathrm{NHC}\left(\mathrm{CH}_{3}\right)\right.\right.$ $\left.\mathrm{OC}_{2} \mathrm{H}_{4}{ }^{3} \mathrm{~N}\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{OH}\right)_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}$ the sixth coordination site is occupied by the $\mathrm{NHC}\left(\mathrm{CH}_{3}\right)$ $\left.\mathrm{OC}_{2} \mathrm{H}_{4}\right\} \mathrm{N}\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{OH}\right)_{2}$ ligand. Details of the crystallographic data collection and the refinement of the structures are presented in Table S1. Table S2 contains the bond lengths and angles in the coordination sphere for the two structures. The bond length between the Ru -atom and the nitrogen atom of the sixth ligand is slightly longer ( $0.028(4) \AA$ ) for the $\left.\mathrm{NHC}\left(\mathrm{CH}_{3}\right)-\mathrm{OC}_{2} \mathrm{H}_{4}\right\} \mathrm{N}\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{OH}\right)_{2}$ ligand.

ORTEP drawings of $\left.\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]^{2+}$ (left) and $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left\{\mathrm{NHC}\left(\mathrm{CH}_{3}\right)-\mathrm{OC}_{2} \mathrm{H}_{4}\right\} \mathrm{N}_{\left.\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{OH}\right)_{2}\right]^{2+} \text { (right) }}\right.$ cations.

The dihedral angle between the two dmb ligands is smaller in $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left\{\mathrm{NHC}\left(\mathrm{CH}_{3}\right)\right.\right.$ $\left.\left.\mathrm{OC}_{2} \mathrm{H}_{4}\right\} \mathrm{N}\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{OH}\right)_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}$ due to the larger size of the sixth ligand. Details of the hydrogen bonding in $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left\{\mathrm{NHC}\left(\mathrm{CH}_{3}\right)-\mathrm{OC}_{2} \mathrm{H}_{4}\right\} \mathrm{N}\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{OH}\right)_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}$ are shown in Table S3. The -OH groups at the end of the $\left\{\mathrm{NHC}\left(\mathrm{CH}_{3}\right)-\mathrm{OC}_{2} \mathrm{H}_{4}\right\} \mathrm{N}\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{OH}\right)_{2}$ ligand form hydrogen bonds with the - OH groups on a symmetry-related molecule. The ligand is somewhat disordered as it stretches away from the coordinated nitrogen because of the long flexible chain which contains both the donor groups and the accepting groups for the hydrogen bonds.

Table S1. Crystallographic Collection and Refinement Data for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}\left(\mathrm{CO}_{2}\right)\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]\left(\mathrm{PF}_{6}\right)_{2}$ and $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left\{\mathrm{NHC}^{2}\left(\mathrm{CH}_{3}\right)-\mathrm{OC}_{2} \mathrm{H}_{4}\right\} \mathrm{N}^{\left.\left(\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{OH}\right)_{2}\right]\left(\mathrm{PF}_{6}\right)_{2}}\right.$
$\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]\left(\mathrm{PF}_{6}\right)_{2} \quad\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left\{\mathrm{NHC}\left(\mathrm{CH}_{3}\right)-\right.\right.$

## 4. Determination of equilibrium constant for the Zwitterionic capture of $\mathrm{CO}_{2}$.

The equilibrium constant for the reaction described below was obtained via titration measurements of known amounts of $\mathrm{CO}_{2}$ to a $0.7 \mathrm{M} \mathrm{TEOA} / \mathrm{CH}_{3} \mathrm{CN}$ solution while monitoring the mid-infrared absorption region characteristic of the $\mathrm{C}=\mathrm{O}$ vibrations.

$$
\mathrm{CO}_{2}+\mathrm{TEOA} \rightleftharpoons \mathrm{CO}_{2} \mathrm{TEOA}
$$

First, the molar absorption coefficient of free $\mathrm{CO}_{2}$ was quantified in $\mathrm{CH}_{3} \mathrm{CN}$, Figure S 3 . Two syringe pumps with gas-tight syringes - one containing $\mathrm{CO}_{2}$-saturated $\mathrm{CH}_{3} \mathrm{CN}(0.28 \mathrm{M})$ and another with $\mathrm{N}_{2}$-saturated $\mathrm{CH}_{3} \mathrm{CN}$ - were used for the controllable mixing into an IR flow cell. The antisymmetric vibration of $\mathrm{CO}_{2}, 2342 \mathrm{~cm}^{-1}$, was monitored as a function of the titrated amount of $\mathrm{CO}_{2}$, from which the molar absorption coefficient was calculated $\left(\varepsilon=2039 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$. At $\mathrm{CO}_{2}$ concentrations $>20 \mathrm{mM}$, the IR absorption at $2342 \mathrm{~cm}^{-1}$ diverged from the predicted linear behavior of the Beer-Lambert law, and the IR absorption at $2330 \mathrm{~cm}^{-1}$ was used instead ( $\varepsilon=345$ $\mathrm{M}^{-1} \mathrm{~cm}^{-1}$ ).

Figure S3. a) Mid-infrared absorption reporting on the $v(\mathrm{CO})$ vibration of $\mathrm{CO}_{2}$, at the indicated concentrations in $\mathrm{CH}_{3} \mathrm{CN}$. b) Plot of the concentration dependence of the absorbance, from which molar absorption coefficients at the indicated wavenumbers were obtained using the Beer-Lambert relationship. The spectral resolution of the FTIR spectrometer was set to $2 \mathrm{~cm}^{-1}$ for these measurements.

Knowing the molar absorption coefficient of $\mathrm{CO}_{2}$ in $\mathrm{CH}_{3} \mathrm{CN}$ allowed for quantification of its concentration via FTIR absorption measurements. The zwitterionic capture of $\mathrm{CO}_{2}$ was monitored by using three syringe pumps containing: i) $\mathrm{N}_{2}$-saturatured $1.4 \mathrm{M} \mathrm{TEOA} / \mathrm{CH}_{3} \mathrm{CN}$, ii) $\mathrm{N}_{2}$-saturated $\mathrm{CH}_{3} \mathrm{CN}$, and iii) $\mathrm{CO}_{2}$-saturated $\mathrm{CH}_{3} \mathrm{CN}$ solutions in gas-tight syringes. This configuration allowed for the titration of known amounts of free $\mathrm{CO}_{2}$ into a $0.7 \mathrm{M} \mathrm{TEOA} / \mathrm{CH}_{3} \mathrm{CN}$ solution. The known concentration of added $\mathrm{CO}_{2}$ was compared to that determined by the IR absorption at $2342 \mathrm{~cm}^{-1}$
(or $2330 \mathrm{~cm}^{-1}$ ) and the difference between them was assumed to be captured by TEOA to form the $\mathrm{CO}_{2}$-TEOA zwitterion. Figure S 4 a compares the $\mathrm{CO}_{2}$-TEOA concentration with the free $\mathrm{CO}_{2}$ in solution, from which the slope provided a measure of the equilibrium constant, $K_{\text {eq }}=0.07 \mathrm{M}^{-1}$, according to,

$$
K_{e q}=\frac{\left[\mathrm{CO}_{2}-\mathrm{TEOA}\right]}{\left[\mathrm{CO}_{2}^{f}\right][T E O A]} \quad ; \quad\left[\mathrm{CO}_{2}-T E O A\right]=K_{e q}[T E O A]\left[\mathrm{CO}_{2}^{f}\right]
$$

where the superscript $f$ in $\left[\mathrm{CO}_{2}^{f}\right]$ denotes the concentration of unreacted - or free $-\mathrm{CO}_{2}$ that exists in the equilibrated mixture. The assumption that [TEOA] $\gg\left[\mathrm{CO}_{2}-\mathrm{TEOA}\right]$ was considered here.

The absorbance of the new IR band at $1646 \mathrm{~cm}^{-1}$ was plotted against the determined $\mathrm{CO}_{2}$ TEOA concentration to obtain the molar absorption coefficient of the carbonyl asymmetric stretching band of the $\mathrm{CO}_{2}$-TEOA zwitterion, Figure $\mathrm{S} 4 \mathrm{~b}\left(\varepsilon=333 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$.

Figure S4. a) Plot of the calculated concentration of the zwitterionic $\mathrm{CO}_{2}$-TEOA adduct as a function of the existing free $\mathrm{CO}_{2}$ in the equilibrium mixture, from which the slope of the linear dependency provided an estimate for the equilibrium constant described in Figure 2c. b) BeerLambert plot of the $\mathrm{CO}_{2}$-TEOA absorption peak measured at $1646 \mathrm{~cm}^{-1}$. The spectral resolution of the FTIR spectrometer was set to $2 \mathrm{~cm}^{-1}$ for these measurements.
5. Supplementary cyclic voltammograms of $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ and $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$.

Figure S5. Cyclic voltammograms for a 1 mM solution of the $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ complex measured at the indicated scan rates, in 0.1 M TBAPF 6 anhydrous $\mathrm{CH}_{3} \mathrm{CN}$. Potentials were converted to NHE using $E_{1 / 2}\left(\mathrm{Fc}^{+/ 0}\right)=0.63 \mathrm{~V}$ vs NHE in $\mathrm{CH}_{3} \mathrm{CN}$ as the scaling factor. ${ }^{1}$

Figure S6. Cyclic voltammograms for a 1 mM solution of the $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$complex measured at the indicated scan rates, in a) 0.1 M TBAPF 6 anhydrous $\mathrm{CH}_{3} \mathrm{CN}$ and b) with added 50 mM TEOA. Shown in panels c) and d) are overlaid fits (black traces) of $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$ voltammogram data at the indicated scan rates in $\mathrm{CH}_{3} \mathrm{CN}$ and 50 mM TEOA $/ \mathrm{CH}_{3} \mathrm{CN}$ respectively. Potentials were converted to NHE using $E_{1 / 2}\left(\mathrm{Fc}^{+/ 0}\right)=0.63 \mathrm{~V}$ vs NHE in $\mathrm{CH}_{3} \mathrm{CN}$ as the scaling factor. ${ }^{1}$

The equations used in the DigiSim simulation software to model the electrochemical data are listed in Table S4.

Table S4. Equations used in the DigiSim simulations shown in Figures S6c and S6d.

|  |  | $\mathrm{CH}_{3} \mathrm{CN}$ | 50 mM TEOA/CH3 CN |
| :--- | :--- | :---: | :---: |
| $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}+\mathrm{e}^{-} \rightleftharpoons \mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{0}$ | $1^{\text {st }}$ electrochemical step | $\checkmark$ | $\checkmark$ |
| $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{0} \rightleftharpoons \mathrm{Ru}(\mathrm{CO})^{+}+\mathrm{HCOO}^{-}$ | $1^{\text {st }}$ chemical step | $\checkmark$ | $\checkmark$ |
| $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{0}+\mathrm{e}^{-} \rightleftharpoons \mathrm{Ru}(\mathrm{CO})\left(\mathrm{HCOO}^{-}\right.$ | $3^{\text {nd }}$ electrochemical step | $\checkmark$ |  |
| $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{-} \rightleftharpoons \mathrm{Ru}(\mathrm{CO})^{0}+\mathrm{HCOO}^{-}$ | $2^{\text {nd }}$ chemical step | $\checkmark$ |  |

Table S5 lists the equilibrium and kinetic parameters for formate dissociation from the singly- and doubly-reduced $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$complex, obtained from the DigiSim simulations shown in Figures S6b and S6c. We should note that due to the large number of equations used in the simulations (Table S4), and thus the large number of fitting parameters, these values may be subject to large errors.

Table S5. Equilibrium and kinetic parameters for $\mathrm{HCOO}^{-}$dissociation. ${ }^{\text {a }}$

| Reaction | $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$Kinetic Parameters |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{CH}_{3} \mathrm{CN}$ |  | $50 \mathrm{mM} \mathrm{TEOA} / \mathrm{CH}_{3} \mathrm{CN}$ |  |
|  | $K_{\text {eq }}(\mathrm{M})$ | $k_{\text {f }}\left(\mathrm{s}^{-1}\right)$ | $K_{\text {eq }}(\mathrm{M})$ | $k_{\mathrm{f}}\left(\mathrm{s}^{-1}\right)$ |
| $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{0} \rightleftharpoons \mathrm{Ru}(\mathrm{CO})^{+}+\mathrm{HCOO}^{-}$ | 0.03 | 0.07 | 3.9 | 1.0 |
| $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{-} \rightleftharpoons \mathrm{Ru}(\mathrm{CO})^{0}+\mathrm{HCOO}^{-}$ | 430 | 0.66 |  |  |

${ }^{\text {a }}$ Values were extracted from simulated scan-rate dependent cyclic voltammograms of the $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$catalyst shown in Figure S6.

## 6. Na-Hg Reduction

## Experimental Procedure for $\mathrm{Na}-\mathrm{Hg}$ Reduction

Sodium amalgam ( $\sim 0.5 \% \mathrm{Na}$ in Hg ) was prepared by dissolving sodium metal in mercury in a fume hood and storing under argon. Spectroscopic grade $\mathrm{CH}_{3} \mathrm{CN}$ was dried over $\mathrm{CaH}_{2}$, distilled, and degassed by carrying out freeze-thaw cycles using a high-vacuum line. After molecular sieves in a round bottom flask were activated at $300{ }^{\circ} \mathrm{C}$ overnight using a high-vacuum line, the purified $\mathrm{CH}_{3} \mathrm{CN}$ was vacuum-transferred into the glassware containing the activated molecular sieves.

Home-made glassware equipped with an optical cell ( $1-10 \mathrm{~mm}$ pathlength $)$, a $\mathrm{Na}-\mathrm{Hg}$ chamber separated by a glass frit and a metal valve (or high-vacuum stopcock) was used for $\mathrm{Na}-\mathrm{Hg}$ reduction experiments. The typical amount of metal complex used was much less than 1 mg , and an excess of $\mathrm{Na}-\mathrm{Hg}$ was used. The glassware was placed on a high-vacuum line ( $\sim 10^{-6}$ torr) and the $\mathrm{CH}_{3} \mathrm{CN}$ mentioned above ( $2-4 \mathrm{~mL}$ ) was vacuum-distilled into it. The glassware was then sealed and removed from the vacuum line. Stepwise $\mathrm{Na}-\mathrm{Hg}$ reduction of the complex was performed under vacuum by moving a small amount of the solution to the $\mathrm{Na}-\mathrm{Hg}$ chamber for a short time, and then back into the other chamber, followed by a UV-vis spectral measurement. The reduction process was gradually continued in this manner, with each step of the reduction resulting from the net transfer of one electron to the metal complex being determined by a loss of isosbestic points in the UV-vis spectra. This method has previously been used by our group for various systems. ${ }^{2-7}$

Figure S7. Sodium amalgam ( $\mathrm{Na}-\mathrm{Hg}$ ) reduction of the (a) $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+}$and (b) $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ complexes in $\mathrm{CH}_{3} \mathrm{CN}$. c) Comparison of the UV-vis spectrum of $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ after being reduced by two electrons with the spectrum for $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+}$. d) Comparison of the UV-vis spectrum of $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ after being reduced by three electrons with the spectrum for $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{0}$. The diagram at the bottom describes the expected redox states and chemical transformations for each complex. A list of the isosbestic points used to monitor each reduction step is provided below.

| Reduction Step | Isosbestic Point $(\mathrm{nm})$ |
| :--- | :---: |
| $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+}+\mathrm{e}^{-} \rightarrow \mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{0}$ | 312 |
| $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{0}+\mathrm{e}^{-} \rightarrow \mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{-}$ | 300 |
|  |  |
| $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}+\mathrm{e}^{-} \rightarrow \mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{+}$ | $298 / 321$ |
| $\operatorname{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{+}+\mathrm{e}^{-} \rightarrow \mathrm{Ru}(\mathrm{CO})^{0}$ | 311 |
| $\operatorname{Ru}(\mathrm{CO})^{0}+\mathrm{e}^{-} \rightarrow \mathrm{Ru}(\mathrm{CO})^{-}$ | 301 |

7. Supplementary charge recombination kinetics from the singly-reduced $R u(C O)(X)^{(n-1)+}$ complexes to $\mathrm{BIH}^{+}$, in the absence of TEOA.

Figure S8. Time-dependent concentration traces of singly-reduced $\mathrm{Ru}(\mathrm{CO})(\mathrm{X})^{(\mathrm{n}-1)+}$ complexes measured at their corresponding $v(\mathrm{CO})$ peak, in $\mathrm{N}_{2}$-saturated $\mathrm{CH}_{3} \mathrm{CN}$ solutions containing 5 mM $\mathrm{Ru}(\mathrm{CO})(\mathrm{X})^{\mathrm{n}+}, 0.5 \mathrm{mM}\left[\mathrm{Ru}(\text { bpy-OMe })_{3}\right]^{2+}$ and 0.2 M BIH . Overlaid in black are fits to a second order equal concentration kinetic function.

The spectral changes corresponding to each kinetic trace in Figure S8 can be found in:

| Kinetic trace | Full transient spectra |
| :--- | :--- |
| Figure S8a | Figure 5a |
| Figure S8b | Figure S9a |
| Figure S8c | Figure 6a |
| Figure S8d | Figure 7a |

Figure S9. TRIR absorption changes of the $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$ complex measured at the indicated time delays after pulsed 532 nm excitation of the $\left[\mathrm{Ru}(\mathrm{bpy}-\mathrm{OMe})_{3}\right]^{2+}$ chromophore: a) measured in neat $\mathrm{CH}_{3} \mathrm{CN}$ solution and b) measured in $1.4 \mathrm{M} \mathrm{TEOA} / \mathrm{CH}_{3} \mathrm{CN}$ solution. Overlaid are spectral simulations based on a least squares fit of known $v(\mathrm{CO})$ IR spectra. c) Simulated time-dependent concentration profile of the transient species based on the least-squares fit global analysis. Note that data in the $2005-1980 \mathrm{~cm}^{-1}$ range are not available due to the available tuning ranges of our infrared laser probes.

Figure S10. Kinetic traces measured at $1894 \mathrm{~cm}^{-1}$ that report on the concentration profile of the photochemically-generated, singly-reduced $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{0}$ complex. Experiments were performed by varying the titrated amount of supporting base, a) TEA, b) TBAHCOO ${ }^{-}$, and c) DBU. Overlaid in yellow are fits to the numerical solution of equations 1 and 2 described in the main text. The graphs that follow in the bottom panel are representative of the observed rate constants for deprotonation of $\mathrm{BIH}^{++}$as a function of the concentration of added base, from which the secondorder rate constants were calculated. The graph shown at the bottom of Figure S10 relates the logarithm of the measured $k_{\mathrm{dp}}$ with the corresponding $\mathrm{p} K_{\mathrm{a}}$ of the conjugate acid of the added Brønsted base.
8. Supplementary TRIR data for $\mathrm{Ru}(\mathrm{CO})(\mathrm{CO}-\mathrm{TEOA})^{+}, \mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$and $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+}$.

Figure S11. Representative least squares global fit analysis of the $\mathrm{Ru}(\mathrm{CO})(\mathrm{CO}-\mathrm{TEOA})^{+}$TRIR data taken at $15 \mu \mathrm{~s}$ after pulsed 532 nm excitation of the $\left[\mathrm{Ru}(\text { bpy-OMe })_{3}\right]^{2+}$ chromophore in 1.4 M $\mathrm{TEOA} / \mathrm{CH}_{3} \mathrm{CN}, \mathrm{N}_{2}$-saturated solution. The reference spectra of the bleached $\mathrm{Ru}(\mathrm{CO})(\mathrm{CO}-$ TEOA $)^{+}, \mathrm{Ru}(\mathrm{CO})(\mathrm{CO}-\mathrm{TEOA})^{0}$ and $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{+}$were included to satisfactorily model the transient data.

Figure S12. a) Representative least squares global fit analysis of the $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$TRIR data taken at $5 \mu \mathrm{~s}$ after pulsed 532 nm excitation of the $\left[\mathrm{Ru}(\text { bpy-OMe })_{3}\right]^{2+}$ chromophore in 1.4 M $\mathrm{TEOA} / \mathrm{CH}_{3} \mathrm{CN}, \mathrm{N}_{2}$-saturated solution. The reference spectra of the bleached $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$, $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{0}$ and $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{+}$were included to satisfactorily model the transient data. b) TRIR absorption changes of the $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{+}$complex at the indicated time delays after pulsed 532 nm excitation of the $\left[\mathrm{Ru}(\text { bpy-OMe })_{3}\right]^{2+}$ chromophore in 50 mM TBAHCOO/ $\mathrm{CH}_{3} \mathrm{CN}$ solution. Overlaid are spectral simulations based on a least squares fit of the indicated known $v(\mathrm{CO})$ IR spectra. c) Simulated time-dependent concentration profile of the singly-reduced $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{0}$ based on the least-squares fit global analysis.

Figure S13. a) TRIR absorption changes of the $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+}$complex at the indicated time delays after pulsed 532 nm excitation of the $\left[\mathrm{Ru}(\text { bpy-OMe })_{3}\right]^{2+}$ chromophore in 50 mM TBAHCOO/ $\mathrm{CH}_{3} \mathrm{CN}, \mathrm{N}_{2}$-saturated solution. Overlaid are spectral simulations based on a least squares fit of the data with the known IR spectra for $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+}$and $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{0}$. b) Normalized kinetic traces at $1894 \mathrm{~cm}^{-1}$, measured in 50 mM TBAHCOO/ $\mathrm{CH}_{3} \mathrm{CN} \mathrm{N}_{2}$-saturated solution, 50 mM TBAHCOO/ $\mathrm{CH}_{3} \mathrm{CN} \mathrm{CO}_{2}$-saturated solution, or $1.4 \mathrm{M} \mathrm{TEOA} / \mathrm{CH}_{3} \mathrm{CN} \mathrm{N}_{2}$-saturated solution. c) Transient absorption changes indicative of the hydride transfer step to $\mathrm{CO}_{2}$ measured at the $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{0}$ peak, $1894 \mathrm{~cm}^{-1}$, for the indicated concentrations of $\mathrm{CO}_{2}$ in 50 mM TBAHCOO $/ \mathrm{CH}_{3} \mathrm{CN}$ solutions. d) Plot of the observed rates of decay from panel c as a function of the $\mathrm{CO}_{2}$ concentration, from which the second-order rate constant for hydride transfer to $\mathrm{CO}_{2}$ was obtained.

Figure S14. a) Representative least squares global fit analysis of the data in Figure 7 b taken at 15 $\mu \mathrm{s}$ after pulsed 532 nm excitation. The reference spectra of the bleached $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+}, \mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{0}$, $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{0}$ and $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{+}$were included to satisfactorily model the transient data. b) Single kinetic traces measured at wavenumbers that corresponded to absorption changes predominant of the indicated transient species (the data were converted to concentration profiles using the known molar absorption coefficients of each species and the cell pathlength); the raw kinetic trace representative of $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{0}$ at $1938 \mathrm{~cm}^{-1}$ was subtracted by the contribution of bleached $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+}$. Plots of the observed rates for the formation of $\mathrm{Ru}(\mathrm{CO})(\mathrm{HCOO})^{0}$ as a function of (c) the $\mathrm{CO}_{2}$ concentration, and (d) the $\mathrm{CO}_{2}$-TEOA concentration, from which the second-order rate constants for hydride transfer to $\mathrm{CO}_{2}$ and $\mathrm{CO}_{2}$-TEOA, were obtained, respectively.

## 9. Hydricity determination and thermodynamic relationships used for the calculation of hydricity

 and $p K_{a}$ of the metal hydrides in acetonitrile solutions.The hydricity value for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$was determined experimentally using the direct hydride transfer method relative to $[\mathrm{Ru}(\mathrm{HMB})(\mathrm{bpy})(\mathrm{H})]^{+}\left(\Delta G_{\mathrm{H}^{-}}=54 \pm 2 \mathrm{kcal} \mathrm{mol}^{-1}\right)^{8}$ as the reference hydride, and relative to the hydricity of $\mathrm{H}_{2}$ by stoichiometric addition of protonated triethylamine, ${ }^{9} \mathrm{TEAH}^{+}\left(\mathrm{p} K_{\mathrm{a}}=18.82\right)^{10-11}$, as the proton source.

Figure $\mathrm{S} 15 .{ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of the reaction equilibrium illustrated in the figure in $\mathrm{CD}_{3} \mathrm{CN}$ solution. The metal hydrides, $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$and $\left[\mathrm{Ru}(\mathrm{HMB})(\mathrm{bpy})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]^{2+}$ were mixed at near equimolar quantities for six independent experiments, from which the obtained equilibrium constants were used to calculate an average hydricity value.

Figure S 15 shows the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of the solution mixture $\left(\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}\right.$: $\left[\mathrm{Ru}(\mathrm{HMB})(\mathrm{bpy})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]^{2+}$ in $\left.\mathrm{CD}_{3} \mathrm{CN}\right)$ at near equimolar concentration before and after the reaction has achieved equilibrium. The solution mixture was heated to $80^{\circ} \mathrm{C}$ for multiple intervals of 10 minutes and the reaction equilibrium was monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ at $25^{\circ} \mathrm{C}$. Equilibrium was established after 1 hour of accumulated heating. The indicated integral values were used to
quantify the equilibrium constants, from which a hydricity value for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$of $\Delta G_{\mathrm{H}^{-}}$ $=51 \pm 0.5 \mathrm{kcal} \mathrm{mol}^{-1}$ was obtained relative to $[\mathrm{Ru}(\mathrm{HMB})(\mathrm{bpy})(\mathrm{H})]^{+}\left(\Delta G_{\mathrm{H}^{-}}=54 \pm 2 \mathrm{kcal} \mathrm{mol}^{-1}\right)$ using equation S 1 . The obtained value was averaged over six independent experiments at similar conditions.
$\Delta G_{\mathrm{H}^{-}}=\Delta G_{\mathrm{H}^{-}}($ref. $)-1.364 \log \left(K_{\mathrm{eq}}\right)$
In a separate experiment, $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$and TEAH ${ }^{+}$were mixed in a 1:10 concentration ratio in $\mathrm{CD}_{3} \mathrm{CN}$ and added to an air-free NMR tube. Equilibrium was monitored at multiple intervals of 10 minutes of heating at $80^{\circ} \mathrm{C}$. Equilibrium was achieved after 1 hour. The hydricity of $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$was determined by measuring the equilibrium constant for,

$$
\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}+\mathrm{TEAH}^{+} \rightleftharpoons\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]^{2+}+\mathrm{TEA}+\mathrm{H}_{2}
$$

according to equation S 2 ,
$\Delta G_{\mathrm{H}^{-}}=-1.364 \times \log \left(K_{\mathrm{eq}}\right)-1.364 \times \mathrm{p} K_{\mathrm{a}}\left(\mathrm{TEAH}^{+}\right)+77$
Integration of the NMR data for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$and $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]^{2+}$ provided $K_{\mathrm{eq}}=3.68 \mathrm{~atm}$ (the amount of $\mathrm{TEAH}^{+}$converted to TEA was assumed to be equal to the amount of $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$that has been converted to $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]^{2+}$; similarly, the partial pressure of $\mathrm{H}_{2}$ was calculated by assuming that the amount of $\mathrm{H}_{2}$ produced was equal to $\left.\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]^{2+}\right)$. The hydricity obtained by this method for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$, $\Delta G_{\mathrm{H}^{-}}=50.6 \mathrm{kcal} \mathrm{mol}^{-1}$, is in good agreement with the value determined using the direct hydride transfer method.

The final hydricity for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}, \Delta G_{\mathrm{H}^{-}}=51 \pm 0.5 \mathrm{kcal} \mathrm{mol}^{-1}$, was obtained by averaging the values from the two experimental methods discussed above.

Complementary DFT calculations were also conducted to estimate the hydricity value of $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$using an isodesmic relationship with $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{+}$as the reference metal hydride $\left(\Delta G_{\mathrm{H}^{-}}=39 \pm 3 \mathrm{kcal} \mathrm{mol}^{-1}\right) .^{5,12}$ We note here that the original work from Creutz and co-authors experimentally determined the hydricity of $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{+}$as $\Delta G_{\mathrm{H}^{-}}=39 \pm 3 \mathrm{kcal}$ $\mathrm{mol}^{-1},{ }^{5}$ while a review article from Appel, Miller and co-authors on hydricity of metal hydrides mistakenly cited this value with too high a precision, ${ }^{8} 39.3 \mathrm{kcal} \mathrm{mol}^{-1}$. The reaction free energy change for a hydride transfer between $\mathrm{Ru}($ tpy $)(\mathrm{bpy})(\mathrm{H})^{+}$and $\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}$,
$\mathrm{Ru}($ tpy $)($ bpy $) \mathrm{H}^{+}+\mathrm{Ru}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+} \rightleftharpoons \mathrm{Ru}($ tpy $)(\mathrm{bpy})\left(\mathrm{CH}_{3} \mathrm{CN}\right)^{2+}+\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+}\left(\Delta G^{\mathrm{o}}=-11.5 \mathrm{kcal} / \mathrm{mol}^{-1}\right) \mathrm{S} 3$ was computationally determined by comparing the total free energies of each optimized structure. This value was then added to the hydricity of the reference compound, $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{+}$. In using this approach, errors inherent to the computational methods are thought to be minimized since they are cancelled out by taking the difference in free energy. The computed free energy for the reaction equilibrium described in equation S 3 was $\Delta G^{\mathrm{o}}=-11.5 \mathrm{kcal} \mathrm{mol}^{-1}$ exergonic, and therefore provided a calculated hydricity for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$of $\Delta G_{\mathrm{H}^{-}}=50.8 \mathrm{kcal} \mathrm{mol}^{-1}$.

For all other hydricity values - at different redox states of the metal hydride - as well as the acidity $\left(\Delta G_{\mathrm{H}^{+}}=1.364 \times \mathrm{p} K_{\mathrm{a}}\right)$ and the homolytic M-H bond cleavage $\left(\Delta G_{\mathrm{H}^{\cdot}}\right)$, thermochemical cycles were used by relating these quantities to reduction potentials $\left(E_{1 / 2}\right)$ through free energy relationships. ${ }^{8}$ The diagram below exemplifies this combination of free energies for a cationic metal hydride $[\mathrm{M}-\mathrm{H}]^{+}$- in its resting state - and its hypothetically accessible redox states, with those of the parent complex which considers a solvent molecule coordinated to the metal. Note that the diagram below omits the signs (positive or negative) that accompany each thermodynamic quantity for a specific reaction path.

In addition to the free energy parameters depicted above, the thermodynamic constants that connect $\mathrm{H}^{+}, \mathrm{H}^{+}, \mathrm{H}^{-}$and $\mathrm{H}_{2}$ must be adequately included to complete specific thermodynamic cycles. ${ }^{8}$ For a complete list of these physical quantities, the authors recommend the review article in reference [2]. For this discussion, only the thermodynamic free energy required for the reactions listed below will be considered relevant.

$$
\mathrm{H}_{\text {(solv) }}^{+}+\mathrm{e}^{-} \rightleftharpoons \mathrm{H}_{\text {(solv) }}^{\circ} \quad \Delta G_{\mathrm{H}^{+} / \mathrm{H}^{+}}^{o}=53.6 \mathrm{kcal} \mathrm{~mol}^{-1}
$$

$$
\underline{H}_{(\text {solv })}^{-}+\mathrm{e}^{-} \rightleftharpoons \mathrm{H}_{(\text {solv })}^{-} \quad \Delta G_{\mathrm{H}^{\cdot} / \mathrm{H}^{-}}^{o}=26 \mathrm{kcal} \mathrm{~mol}^{-1}
$$

Standard free energy values at $1 \mathrm{M} \mathrm{H}, \mathrm{H}^{+}$, and $\mathrm{H}^{-}$, referenced to the $\mathrm{Fc}^{+0}$ couple.
According to the diagram above, a series of mathematical representations may be written to quantify a particular thermodynamic quantity of interest, yet they all must afford self-consistent values throughout. Equation S 5.4 describes the homolytic bond dissociation free energy, $\Delta G_{\mathrm{H}^{\bullet}}$, of a metal hydride, $[\mathrm{M}-\mathrm{H}]^{+}$in terms of its hydricity value and the first reduction potential of the parent solvent complex, $[\mathrm{M}]^{2+}$.

| $[\mathrm{M}-\mathrm{H}]^{+} \rightleftharpoons[\mathrm{M}]^{2+}+\mathrm{H}^{-}$ | $\Delta G_{\mathrm{H}^{-}}$ | $(-39)^{\text {a }}$ | $(-51)^{\text {b }}$ | S5.1 |
| :---: | :---: | :---: | :---: | :---: |

Direct application of Equation S5.4 provided $\Delta G_{\mathrm{H}^{+}}=52 \mathrm{kcal} \mathrm{mol}^{-1}$ for $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{+}$and $\Delta G_{\mathrm{H}^{\cdot}}=63 \mathrm{kcal} \mathrm{mol}^{-1}$ for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$.

The free energy for proton dissociation of a metal hydride, $\Delta G_{H^{+}}$, was determined by combining $\Delta G_{H} \cdot$ and the second reduction of the parent solvento complex according to the set of equations S6.1-S6.4.

| $[\mathrm{M}-\mathrm{H}]^{+} \rightleftharpoons[\mathrm{M}]^{+}+\mathrm{H}^{\cdot}$ | $\Delta G_{\mathrm{H}^{\cdot}}$ | $(51.7)^{\mathrm{a}}$ | $(63.3)^{\mathrm{b}}$ | S 6.1 |

| $[\mathrm{M}-\mathrm{H}]^{+} \rightleftharpoons[\mathrm{M}]^{0}+\mathrm{H}^{+}$ | $\Delta G_{\mathrm{H}^{+}}=\Delta G_{\mathrm{H}^{\cdot}}-F E_{1 / 2}\left(\mathrm{M}^{+/ 0}\right)-\Delta G_{\mathrm{H}^{+} / \mathrm{H}^{\cdot}}$ |  | S 6.4 |  |

${ }^{a}$ Calculation for $[\mathrm{Ru}(\text { tpy })(\mathrm{bpy})(\mathrm{H})]^{+} .{ }^{\mathrm{b}}$ Calculation for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$. Values are given in $\mathrm{kcal} / \mathrm{mol}^{-1}$.
Direct application of equation S6.4 gave $\Delta G_{\mathrm{H}^{+}}=53 \mathrm{kcal} \mathrm{mol}^{-1}$ for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$. With the free energy for proton dissociation being related to the acidity of a metal-hydride bond through $\Delta G_{\mathrm{H}^{+}}=1.364 \times \mathrm{p} K_{a},{ }^{8}\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$has $\mathrm{p} K_{\mathrm{a}}=39$. The methodology described above was also applied to $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{+}$, from which $\Delta G_{\mathrm{H}^{+}}=43 \mathrm{kcal} \mathrm{mol}^{-1}$ and $\mathrm{p} K_{\mathrm{a}}=32$ were obtained. The hydricity value and reduction potentials for $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{+}$were available from reference [6]. ${ }^{5}$

The homolytic cleavage of the metal hydride bond for the singly-reduced complexes was calculated using the thermochemical cycle described by the set of equations S7.1-S7.4, which relate the acidity of the resting state of the metal hydride with its first reduction potential.

| $[\mathrm{M}-\mathrm{H}]^{+} \rightleftharpoons[\mathrm{M}]^{0}+\mathrm{H}^{+}$ | $\Delta G_{\mathrm{H}^{+}}$ | $(43.8){ }^{\text {a }}$ | $(52.6)^{\text {b }}$ | S7.1 |
| :---: | :---: | :---: | :---: | :---: |
| $[\mathrm{M}-\mathrm{H}]^{0} \rightleftharpoons[\mathrm{M}-\mathrm{H}]^{+}+\mathrm{e}^{-}$ | $n F E_{1 / 2}\left(\mathrm{M}^{+/ 0}\right) ; n=1$ | $(-23.06 \times 1.98)^{\text {a }}$ | $(-23.06 \times 1.93)^{\text {b }}$ | S7.2 |
| $\underline{\mathrm{H}^{+}+\mathrm{e}^{-} \rightleftharpoons \mathrm{H}^{+}}$ | $\Delta G_{\mathrm{H}^{+} / \mathrm{H}^{\text {- }}}$ | $(53.6)^{\text {a }}$ | $(53.6)^{\text {b }}$ | S7.3 |
| $[\mathrm{M}-\mathrm{H}]^{0} \rightleftharpoons[\mathrm{M}]^{0}+\mathrm{H}^{\bullet}$ | $\Delta G_{\mathrm{H}^{+}}=\Delta G_{\mathrm{H}^{-}}-F E_{1 / 2}$ | $\mathrm{H}^{\cdot} / \mathrm{H}^{-}$ |  | S7.4 |

The obtained values were, $\Delta G_{H^{*}}=52 \mathrm{kcal} \mathrm{mol}^{-1}$ for $[\operatorname{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{0}$ and $\Delta G_{H^{*}}=62 \mathrm{kcal}$ $\mathrm{mol}^{-1}$ for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{0}$.

The hydricity of singly-reduced $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{0}$ was determined according to the set of equations $\mathrm{S} 8.1-\mathrm{S} 8.4$, which relate the $\Delta G_{\mathrm{H}^{\cdot}}$ of the singly-reduced metal hydride with the second reduction potential of the parent solvento complex,

| $[\mathrm{M}-\mathrm{H}]^{0} \rightleftharpoons[\mathrm{M}]^{0}+\mathrm{H}^{\bullet}$ | $\Delta G_{\mathrm{H}}$. | $(51.7)^{\text {a }}$ | (61.7) ${ }^{\text {b }}$ | S8.1 |
| :---: | :---: | :---: | :---: | :---: |
| $[\mathrm{M}]^{0} \rightleftharpoons[\mathrm{M}]^{+}+\mathrm{e}^{-}$ | $n F E_{1 / 2}\left(\mathrm{M}^{+/ 0}\right) ; n=1$ | $(-23.06 \times 2.23)^{\text {a }}$ | $(-23.06 \times 2.13)^{\text {b }}$ | S8.2 |
| $\underline{\mathrm{H}^{\bullet}+\mathrm{e}^{-} \rightleftharpoons \mathrm{H}^{-}}$ | $\Delta G_{\mathrm{H}^{\bullet} / \mathrm{H}^{-}}$ | (26) ${ }^{\text {a }}$ | $(26)^{\text {b }}$ | S8.3 |
| $[\mathrm{M}-\mathrm{H}]^{0} \rightleftharpoons[\mathrm{M}]^{+}+\mathrm{H}^{-}$ | $\Delta G_{\mathrm{H}^{-}}=\Delta G_{\mathrm{H}^{+}}+F E_{1 / 2}$ | $\mathrm{H}^{+} \mathrm{H}^{-}$ |  | S8.4 |

which provided $\Delta G_{\mathrm{H}^{-}}=32 \mathrm{kcal} \mathrm{mol}{ }^{-1}$ for $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{0}$ and $\Delta G_{\mathrm{H}^{-}}=45 \mathrm{kcal} \mathrm{mol}^{-1}$ for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{0}$. The calculated $\Delta G_{\mathrm{H}^{-}}$values for two different redox states of the same metal hydride show that ligand-based reductions inductively increase the electron density at the metalhydride bond, which is translated to lower hydricity values - or better hydride donors - while the homolytic cleavage to yield a $\mathrm{H}^{-}$-atom is little affected. This observation is in accordance with the fact that reported hydricities for metal hydrides span a wide range of more than $50 \mathrm{kcal} \mathrm{mol}^{-1},{ }^{8,13}$ while $\Delta G_{\mathrm{H}} \cdot$ typically varies within a narrower range of $20 \mathrm{kcal} \mathrm{mol}^{-1} .{ }^{14-17}$

The acidity of singly-reduced metal hydrides is usually challenging to obtain using thermochemical cycles, as it requires a knowledge of the third reduction of the solvento complex, according to the set of equations S9.1-S9.4.

| $[\mathrm{M}-\mathrm{H}]^{0} \rightleftharpoons[\mathrm{M}]^{0}+\mathrm{H}^{\bullet}$ | $\Delta G_{\mathrm{H}^{\cdot}}$ | $(51.7)^{\mathrm{a}}$ | $(61.7)^{\mathrm{b}}$ | S 9.1 |

| $\mathrm{H}^{\cdot} \rightleftharpoons \mathrm{H}^{+}+\mathrm{e}^{-}$ | $-\Delta G_{\mathrm{H}^{+} / \mathrm{H}^{\cdot}}$ | $(-53.6)^{\mathrm{a}}$ | $(-53.6)^{\mathrm{b}}$ | S 9.3 |
| $[\mathrm{M}-\mathrm{H}]^{0} \rightleftharpoons[\mathrm{M}]^{-}+\mathrm{H}^{+}$ | $\Delta G_{\mathrm{H}^{+}}=\Delta G_{\mathrm{H}^{\cdot}}-F E_{1 / 2}\left(\mathrm{M}^{0 /-}\right)-\Delta G_{\mathrm{H}^{+} / \mathrm{H}^{\cdot}}$ | S 9.4 |  |  |

${ }^{\text {a }}$ Calculation for $[\mathrm{Ru}(\text { tpy })(\mathrm{bpy})(\mathrm{H})]^{0} .{ }^{\mathrm{b}} \mathrm{Calculation} \mathrm{for}\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{0}$. Values are given in $\mathrm{kcal} / \mathrm{mol}^{-1}$.
For $[\mathrm{Ru}(\text { tpy })(\mathrm{bpy})(\mathrm{H})]^{+}$, the third reduction potential of the parent $\left[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]^{2+}$ has been reported to occur at $E_{1 / 2}\left(\mathrm{M}^{0 /-}\right)=-2.33 \mathrm{~V} \mathrm{vs} \mathrm{Fc}^{+/ 0}, 5$ and by using equation S 9.4 , the acidity of $[\mathrm{Ru}(\text { tpy })(\mathrm{bpy})(\mathrm{H})]^{0}$ is $\mathrm{p} K_{\mathrm{a}}=38$. For $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{0}$ studied here, the third reduction potential of $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right]^{2+}$ is in fact related to the one-electron reduction of the 5corrdinate $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})\right]^{0 /-}$, and by using this reduction, $E_{1 / 2}\left(\mathrm{M}^{0 /-}\right)=-2.18 \mathrm{~V} \mathrm{vs} \mathrm{Fc}^{+/ 0}$, the acidity of $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{0}$ was estimated as $\mathrm{p} K_{\mathrm{a}}=43$.

The homolytic cleavage of the doubly-reduced $[\mathrm{M}-\mathrm{H}]^{-}$was determined using the set of equations S10.1-S10.4, which relate the acidity of the singly-reduced $[\mathrm{M}-\mathrm{H}]^{0}$ with the second reduction of the metal hydride, $[\mathrm{M}-\mathrm{H}]^{0 /-}$.

| $[\mathrm{M}-\mathrm{H}]^{0} \rightleftharpoons[\mathrm{M}]^{-}+\mathrm{H}^{+}$ | $\Delta G_{\mathrm{H}^{+}}$ | $(51.9)^{\mathrm{a}}$ | $(58.3)^{\mathrm{b}}$ | S 10.1 |
| :--- | :--- | :--- | :--- | :--- |
| $[\mathrm{M}-\mathrm{H}]^{-} \rightleftharpoons[\mathrm{M}-\mathrm{H}]^{0}+\mathrm{e}^{-}$ | $n F E_{1 / 2}\left(\mathrm{M}^{0 /-}\right) ; n=1$ | $(-23.06 \times 2.23)^{\mathrm{a}}$ | $(-23.06 \times 2.13)^{\mathrm{b}}$ | S 10.2 |
| $\mathrm{H}^{+}+\mathrm{e}^{-} \rightleftharpoons \mathrm{H}^{\cdot}$ | $\Delta G_{\mathrm{H}^{+} / \mathrm{H}^{\bullet}}$ | $(53.6)^{\mathrm{a}}$ | $(53.6)^{\mathrm{b}}$ | S 10.3 |
| $[\mathrm{M}-\mathrm{H}]^{-} \rightleftharpoons[\mathrm{M}]^{-}+\mathrm{H}^{\bullet}$ | $\Delta G_{\mathrm{H}^{+}}=\Delta G_{\mathrm{H}^{+}}+F E_{1 / 2}\left(\mathrm{M}^{0 /-}\right)+\Delta \mathrm{G}_{\mathrm{H}^{+} / \mathrm{H}^{\cdot}}$ | S 10.4 |  |  |

${ }^{\mathrm{a}}$ Calculation for $[\mathrm{Ru}(\text { tpy })(\mathrm{bpy})(\mathrm{H})]^{-} .{ }^{\mathrm{b}}$ Calculation for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{-}$. Values are given in $\mathrm{kcal} / \mathrm{mol}^{-1}$.
Equation S10.4 provided $\Delta G_{\mathrm{H}^{*}}=54 \mathrm{kcal} \mathrm{mol}^{-1}$ for $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{-}$and $\Delta G_{\mathrm{H}^{*}}=63 \mathrm{kcal} \mathrm{mol}^{-}$ ${ }^{1}$ for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{-}$.

The hydricity of a doubly-reduced $[\mathrm{M}-\mathrm{H}]^{-}$was determined by direct application of equation S11.4, which relates the free energy for the homolytic cleavage of $[\mathrm{M}-\mathrm{H}]^{-}, \Delta G_{\mathrm{H}^{\cdot}}$, with the third reduction of the parent solvento complex, $[\mathrm{M}]^{0 /-}$.

| $[\mathrm{M}-\mathrm{H}]^{-} \rightleftharpoons[\mathrm{M}]^{-}+\mathrm{H}^{\bullet}$ | $\Delta G_{\mathrm{H}}{ }^{\text {. }}$ | $(54)^{\text {a }}$ | $(62.8)^{\text {b }}$ | S11.1 |
| :---: | :---: | :---: | :---: | :---: |
| $[\mathrm{M}]^{-} \rightleftharpoons[\mathrm{M}]^{0}+\mathrm{e}^{-}$ | $n F E_{1 / 2}\left(\mathrm{M}^{0 /-}\right) ; n=1$ | $(-23.06 \times 2.33)^{\text {a }}$ | $(-23.06 \times 2.13)^{\text {b }}$ | S11.2 |
| $\mathrm{H}^{\bullet}+\mathrm{e}^{-} \rightleftharpoons \mathrm{H}^{-}$ | $\Delta G_{\mathrm{H}^{\bullet} / \mathrm{H}^{-}}$ | $(26)^{\text {a }}$ | $(26){ }^{\text {b }}$ | S11.3 |
| $[\mathrm{M}-\mathrm{H}]^{0} \rightleftharpoons[\mathrm{M}]^{+}+\mathrm{H}^{-}$ | $\Delta G_{\mathrm{H}^{-}}=\Delta G_{\mathrm{H}^{+}}+F E_{1 / 2}$ | $\mathrm{H}^{\cdot} / \mathrm{H}^{-}$ |  | S11.4 |

The obtained values were $\Delta G_{\mathrm{H}^{-}}=26 \mathrm{kcal} \mathrm{mol}{ }^{-1}$ for $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{-}$and $\Delta G_{\mathrm{H}^{-}}=39 \mathrm{kcal}$ $\mathrm{mol}^{-1}$ for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{-}$.

Thermodynamic relationships that follow the diagram described in the beginning of this section do not allow for estimation of $\mathrm{p} K_{\mathrm{a}}$ values for metal hydrides, as thermodynamic quantities at higher reducing states are likely inaccessible. The trend in which a metal-hydride becomes more basic ( $\mathrm{p} K_{\mathrm{a}}$ increases) as it becomes more hydridic was realized for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$and $[\mathrm{Ru}(\text { tpy })(\mathrm{bpy})(\mathrm{H})]^{+}$and their corresponding singly-reduced forms. This was also true for $[\operatorname{Ir}(\mathrm{tpy})(\mathrm{ppy})(\mathrm{H})]^{+}$, where ppy $=2$-phenylpyridine, by using reported hydricities and reduction potentials, ${ }^{12}$ although this analysis will not be discussed here. The question of whether the hydricity and $\mathrm{p} K_{\mathrm{a}}$ of the doubly-reduced metal hydrides may follow a monotonic linear trend, is of interest. Shown in Scheme 3 of the main text, the solid red and blue spheres are the ( $\Delta G_{\mathrm{H}^{-}}, \mathrm{p} K_{\mathrm{a}}$ ) xy-pairs of the resting and singly-reduced states of the listed metal hydrides. By considering that a linear trend connects the hydricities and $\mathrm{p} K_{\mathrm{a}}$ of a metal hydride at different redox states with common $\Delta G_{\mathrm{H}^{\cdot}}$, the two ( $\Delta G_{\mathrm{H}^{-}}, \mathrm{p} K_{\mathrm{a}}$ ) points for each metal hydride in Scheme 3 were used to find the equation of a line that connects them,
$\Delta G_{\mathrm{H}^{-}}=-\left(\frac{E_{1 / 2}(+/ 0)-E_{1 / 2}(2+/+)}{E_{1 / 2}(0 /-)-E_{1 / 2}(+/ 0)}\right) \Delta G_{\mathrm{H}^{+}}-C$
where $\Delta G_{\mathrm{H}^{+}}=1.364 \times \mathrm{p} K_{\mathrm{a}}$ and C is a constant. The ratio of the differences in reduction potentials in equation S 12 was 0.74 for $\left[\mathrm{Ru}(\mathrm{dmb})_{2}(\mathrm{CO})(\mathrm{H})\right]^{+}$and 0.86 for $[\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})]^{+}$. In order to generalize the utilization of equation $S 12$, the average value $(0.80)$ was taken, which gives,
$\Delta G_{\mathrm{H}^{-}}=-1.09 \times p K_{a}-C$

Using the known $\Delta G_{H^{-}}$and $\mathrm{p} K_{\mathrm{a}}$ values, the constant $C$ was obtained for each metal hydride; $C$ $=92$ and 74 for $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{+ \text {or } 0}$ and $\mathrm{Ru}($ tpy $)(\mathrm{bpy})(\mathrm{H})^{+ \text {or } 0}$, respectively. The final form of equation S 13 is unique to each metal hydride and its displacement from the Cartesian origin in the x direction indicates a relative measure of the homolytic bond dissociation free energy, $\Delta G_{\mathrm{H}^{+}}$, of a metal hydride - the more distant the $\left(\Delta G_{\mathrm{H}^{-}}, \mathrm{p} K_{\mathrm{a}}\right)$ trend is from the origin in the x-direction, the larger $\Delta G_{\mathrm{H}} \cdot$ will be. By applying the known hydricities of the doubly-reduced metal hydrides, their acidities at this corresponding redox state are $\mathrm{p} K_{\mathrm{a}}=49$ for $\mathrm{Ru}(\mathrm{CO})(\mathrm{H})^{-}$and $\mathrm{p} K_{\mathrm{a}}=44$ for $\mathrm{Ru}(\mathrm{tpy})(\mathrm{bpy})(\mathrm{H})^{-}$.

## 10. Thermodynamic relationships for the determination of the $p K_{a}$ of $\mathrm{BIH}^{+}$.

The $\mathrm{p} K_{\mathrm{a}}$ of the radical cation, $\mathrm{BIH}^{+}$was determined according to the thermodynamic relationships described in the diagram below. Note that, for illustrative clarity of the diagram, the signs (positive or negative) that accompany each thermodynamic quantity for a specific reaction path were omitted.

First, the homolytic bond cleavage of BIH was determined, $\Delta G_{H} \cdot=71.6 \mathrm{kcal} \mathrm{mol}^{-1}$, according to the set of equations S14.1-S14.4. The hydricity and reduction potentials were available from references [10,11]..$^{18-19}$

| $[\mathrm{BIH}] \rightleftharpoons\left[\mathrm{BI}^{+}\right]+\mathrm{H}^{-}$ | $\Delta G_{\mathrm{H}^{-}}$ | $(50.1)$ | S 14.1 |
| :--- | :--- | :--- | :--- |
| $\left[\mathrm{BI}^{+}\right]+\mathrm{e}^{-} \rightleftharpoons\left[\mathrm{BI}^{\bullet}\right]$ | $-n F E_{1 / 2}\left(\mathrm{BI}^{+/ \cdot}\right) ; n=1$ | $(23.06 \times 2.06)$ | S 14.2 |
| $\mathrm{H}^{-} \rightleftharpoons \mathrm{H}^{\bullet}+\mathrm{e}^{-}$ | $-\Delta G_{\mathrm{H}^{\bullet} / \mathrm{H}^{-}}$ | $(-26)$ | S 14.3 |
| $[\mathrm{BIH}] \rightleftharpoons[\mathrm{BI}]+\mathrm{H}^{\bullet}$ | $\Delta G_{\mathrm{H}^{+}}=\Delta G_{\mathrm{H}^{-}}-F E_{1 / 2}\left(\mathrm{BI}^{+/ \cdot}\right)-\Delta G_{\mathrm{H}^{\bullet} / \mathrm{H}^{-}}$ | S 14.4 |  |

With the obtained value for $\Delta G_{\mathrm{H}^{\bullet}}$, the $\mathrm{p} K_{\mathrm{a}}=14.4$ was calculated using the thermodynamic relationships described by the set of equations S15.1-S15.4

| $[\mathrm{BIH}] \rightleftharpoons[\mathrm{BI}]+\mathrm{H}^{\bullet}$ | $\Delta G_{\mathrm{H}}{ }^{\cdot}$ | $(71.6)$ | S 15.1 |
