General Considerations

MDA-MB-231 and DU-145 cells were obtained from American Type Culture Collection (Manassas, VA). Cells were cultured in Dulbecco's modified eagle's medium containing 10% FBS and 1000 units/ml penicillin/streptomycin and were grown at 37 °C and 5% CO₂. Fluorescence assisted cell sorting (FACS) was performed using a Sysmex Cyflow Space fluorescence assisted cell sorter. Data obtained from FACS was processed using Flomax Fcs processing software. Blue light irradiation ($\lambda_{\text{irr}} = 460\text{--}470\text{ nm}$) was performed using an LED panel, made in house, consisting of a project board fitted with 96, 60 mW 5mm blue LED diode bulbs from Chanzon (Shanzhen, China) that irradiate each well of a 96-well plate.

Figure S1: LED panel constructed in house. **Left:** Sideview of blue LED panel while turned off. **Right:** Bottom view of LED panel displaying fit onto 96-well plate while activated.
