## 1. General Information

### 1.1 Materials and methods

Starting materials are commercially available and were purchased from Sigma Aldrich or ABCR (Germany) unless otherwise noted. All commercially available aryl boronic acids were analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy prior to use. Anhydrous acetonitrile was stored over pre-conditioned $3 \AA$ mol sieves for at least 2 days prior to use. Hexafluoro-2-propanol (HFIP) was purchased from FluoroChem and used without further purification. Analytical thin layer chromatography (TLC) was performed on Merck silica gel 60 F254 TLC glass plates and visualized with 254 nm light and potassium permanganate or ceric ammonium molybdate staining solutions followed by heating. Purification of reaction products was carried out by flash chromatography using Brunschwig silica $32-63,60 \AA$ under $0.3-0.5$ bar overpressure. Medium pressure liquid chromatography (MPLC) was performed on a CombiFlash Rf200 System from Teledyne ISCO with built-in UV-detector and fraction collector or manually using silica gel SilicaFlash P60, 40-63 $\mu \mathrm{m}$. Teledyne ISCO RediSep Rf flash columns used have a $0.035-0.070 \mathrm{~mm}$ particle size and 230-400 mesh. Normal phase preparative HPLC purification was conducted on a Teledyne Isco CombiFlash EZ Prep system using a Macherey-Nagel VP 250/21 Nucleosil 50-5 column.

GC-MS measurements were performed on an Agilent GC 7890A with an HP-5MS column ( $30 \mathrm{~m} \times 250 \mu \mathrm{~m}$ $\mathrm{x} 0.25 \mu \mathrm{~m}$ ), with a column flow of $1.7 \mathrm{ml} / \mathrm{min}$ using helium as carrier gas, and an Agilent mass spectrometer 5975C VL MSD operating in $\mathrm{EI}(70 \mathrm{eV})$ positive mode with scan rate from 30 to $600 \mathrm{~m} / \mathrm{z}$. Sample injection was done by an Agilent autosampler ALS 7693, $1 \mu \mathrm{l}$ at $<1 \mathrm{mg} / \mathrm{ml}$ in split mode (split ratio 100:1) with an injection port temperature of $280^{\circ} \mathrm{C}$. The standard method used consisted of the following temperature program: two min at $50^{\circ} \mathrm{C}$, ramp of $20^{\circ} \mathrm{C} / \mathrm{min}$ to $300^{\circ} \mathrm{C}$ followed by a 2 min hold time at $300{ }^{\circ} \mathrm{C}(16.5$ min total time). For volatile analytes including gases, a similar method comprising a temperature program of four minutes at $40^{\circ} \mathrm{C}$ then $20^{\circ} \mathrm{C} / \mathrm{min}$ to $240^{\circ} \mathrm{C}$ was utilized. Gases were injected under manual conditions while solid and liquid analytes were dissolved in dichloromethane ( $1-2 \mathrm{mg} / \mathrm{mL}$ ). High resolution mass spectra were measured by the MS-service of the "Laboratorium für Organische Chemie der ETH Zürich". Values are given as $\mathrm{m} / \mathrm{z}$ and the intensity I\% of the base peak. High-resolution mass spectra (HRMS) were measured on: (a) Waters Micromass AutoSpec Ultima spectrometer (electron impact ion source, EBE triSector mass analyzer); (b) Bruker UltraFlex II (MALDI ion source, TOF mass analyzer); (c) Bruker maXis (ESI ion source, Qq-TOF mass analyzer).

NMR spectra were acquired on a Bruker AVIII HD 300 MHz and 400 MHz spectrometers, Bruker Neo 300 MHz and 400 MHz spectrometers, operating at the denoted spectrometer frequency given in MHz for the specified nucleus. All experiments were acquired at 298.0 K with a calibrated Bruker Variable

Temperature Controller unless otherwise noted. The chemical shifts are reported in parts per million (ppm) and coupling constants $(J)$ are given in Hertz $(\mathrm{Hz}) .{ }^{1} \mathrm{H}$ NMR spectra are reported with the solvent resonance as the reference unless noted otherwise $\left(\mathrm{CD}_{3} \mathrm{CN}\right.$ at $1.94 \mathrm{ppm}, \mathrm{CDCl}_{3}$ at $7.26 \mathrm{ppm}, \mathrm{CD}_{3} \mathrm{OD}$ at 3.31 ppm , $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ at 5.32 ppm, DMSO- $d_{6}$ at 2.50 ppm ). Peaks are reported as $(\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet or unresolved, $\mathrm{br}=$ broad signal, coupling constant(s) in Hz , integration). ${ }^{13} \mathrm{C}$ NMR spectra were recorded with ${ }^{1} \mathrm{H}$-decoupling and are reported with the solvent resonance as the reference unless noted otherwise $\left(\mathrm{CD}_{3} \mathrm{CN}\right.$ at $1.32 \mathrm{ppm}, \mathrm{CDCl}_{3}$ at $77.16 \mathrm{ppm}, \mathrm{CD}_{3} \mathrm{OD}$ at $49.00 \mathrm{ppm}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ at 54.00 ppm, DMSO- $d_{6}$ at 39.52 ppm ). For ${ }^{19} \mathrm{~F}$ NMR, an appropriately calibrated tertiary reference was employed, calibrated according to the literature method for improved reproducibility where 0.00 ppm represents the signal of the second isotopologue of neat $\mathrm{CFCl}_{3} .{ }^{1}$ IR spectra were recorded on a Thermo Fischer Scientific Nicolet 6700 FTIR equipped with a PIKE technologies GladiATRTM or on a Perkin-Elmer BX II using ATR FT-IR technology. The peaks are reported as absorption maxima $\left(\mathrm{cm}^{-1}\right)$. High-resolution mass spectrometric data were obtained at the mass spectrometry service operated by the Laboratory of Organic Melting points were determined on a Büchi Melting Point B-540 apparatus in open capillaries.

### 1.2 High-intensity photoreactor and irradiation vessel

Photoreactors (Figure S 1 ) were custom designed and built by the authors in coordination with the mechanical workshop in the Department of Chemistry and Applied Biosciences at ETH Zürich having blue LEDs, equally spaced in a circle design, powered by a 10.3 A power supply, emitting 350 W of light with the measured UV-Vis spectrum (Figure 2). The LEDs were water cooled and further cooled by built-in fans to maintain an ambient temperature. Reactions were performed in normal 15 mL borosilicate glass at a distance of 3 cm from the light source (LEDs).

### 2.1 Synthesis of $\mathrm{NO}_{2}$-transfer reagents I-IV

$N$-Nitropyrrolidinone (I): ${ }^{2}$ Following the above reported procedure, $\mathrm{Bu}_{4} \mathrm{NNO}_{3}(1.52 \mathrm{~g}, 5 \mathrm{mmol})$ in anhydrous DCM ( 30 mL ) was placed in a 100 mL three-necked round bottom flask equipped with a dropping funnel and nitrogen outlet. The system was placed under inert atmosphere and cooled to $0{ }^{\circ} \mathrm{C}$ using an ice bath. A $10-\mathrm{mL}$ pressure equalizing dropping funnel was charged with triflic anhydride (1.41 $\mathrm{g}, 5 \mathrm{mmol})$. The triflic anhydride was added dropwise to the reaction mixture, and the mixture was stirred for 1 hour at $0{ }^{\circ} \mathrm{C}$. In a dropping funnel was placed pyrrolidin-2-one ( $421 \mathrm{mg}, 5 \mathrm{mmol}$ ) in 10 mL DCM, and the solution was added to the mixture during 10 minutes. The reaction mixture was slowly warmed to room temperature and kept for an additional 12 hours. After the reaction was completed, 25 mL of $5 \%$ $\mathrm{NaHCO}_{3}$ was added and the solution was stirred for 30 minutes, and then extracted with DCM ( $3 \times 30 \mathrm{~mL}$ ). The solvent was removed and crude products were purified by column chromatography over silica gel as indicated. The product was isolated in $65 \%(422.5 \mathrm{mg})$ yield as a yellow solid.

Physical state: yellow solid (m.p. $55^{\circ} \mathrm{C}$ ); ${ }^{1} \mathbf{H} \mathbf{N M R}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 4.14(\mathrm{t}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 2.68(\mathrm{t}$, $J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 2.13(\mathrm{p}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}) ;{ }^{13} \mathbf{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 167.7,47.7,30.9,14.7$; IR 1761, 1540, 1480 1459, 1414, 1365, 1269, 1227, 1138, 1026, 937, 890, 837, 802, 762, 688, 629, 591, 530, 466; HRMS (EI) m/z [M]+ Calcd for $\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{~N}_{2} \mathrm{O}_{3}$ : 130.0378; Found 130.0376.

$N$-Nitrosuccinimide (II): ${ }^{3}$ This is a modification of a known procedure. A 250 mL three-necked round bottomed flask equipped with a dropping funnel and a gas outlet connected to an aqueous sodium hydroxide solution trap, was charged with succinimide ( $15 \mathrm{~g}, 0.15 \mathrm{~mol}$ ) and acetic anhydride ( 57 mL ) and then cooled to $0{ }^{\circ} \mathrm{C}$. Fuming nitric acid ( $99.5 \%$-Sigma Aldrich) ( 57 mL ) was slowly added with a dropping funnel behind a blast shield during 20-30 minutes. Importantly, dry air was rapidly bubbled through the reaction mixture to remove nitrogen oxide. The reaction was then warmed to room temperature and stirred
vigorously for 12 hours. After the reaction was completed, the mixture was cooled to $0^{\circ} \mathrm{C}$, and ice ( 150 g ) and ice-water ( 200 ml ) were added subsequently. The reaction was stirred for an additional 15 minutes leading to the formation of white precipitate. The precipitate was filtered, washed with ice-water ( 100 mL ), and then dried under high-vacuum. The yield of glistening colorless crystalline plates was 10 g ( 64.5 mmol ). Another 2.9 g crop was obtained by extraction of the filtrate with ether ( $3 \times 30 \mathrm{~mL}$ ). Recrystallization from absolute ethanol afforded a white crystalline solid with comparable purity in a total yield of $59 \%$ ( 12.7 g ).

Physical state: white solid (m.p. $89^{\circ} \mathrm{C}$ ); ${ }^{\mathbf{1}} \mathbf{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 2.92(\mathrm{~s}, 4 \mathrm{H}) ;{ }^{13} \mathbf{C} \mathbf{N M R}(75 \mathrm{MHz}$, $\mathrm{MeCN}-d_{3}$ ) $\delta 168,27.5$. ; IR (neat): 1746, 1593, 1423, 1407, 1301, 1264, 1234, 1145, 1047, 1003, 993, 808, 733, 626, 595, 540, 482 (no $\mathrm{H}_{2} \mathrm{O}$ or EtOH observed); HRMS (ESI) m/z [M]+ Calcd for $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{~N}_{2} \mathrm{O}_{4}$ 144.0171; Found 144.0157; Elem. $N$-Nitrophthalimide (III): ${ }^{2}$ This is a modification of a known procedure. A 250 mL three-necked round bottomed flask equipped with a dropping funnel and a gas outlet connected to an aqueous sodium hydroxide solution trap, was charged with phthalimide ( $12.5 \mathrm{~g}, 0.085 \mathrm{~mol}$ ) and acetic anhydride ( 40 mL ). The mixture was cooled to $0{ }^{\circ} \mathrm{C}$ and fuming nitric acid ( 50 mL ) ( $99.5 \%$ from Sigma Aldrich) was added slowly with a dropping funnel behind a blast shield. Importantly, dry air was rapidly bubbled through the reaction mixture to remove excess of nitrogen oxide. The reaction mixture was then warmed to room temperature over a period of 12 hours. After the reaction was completed, the mixture was placed in freezer at $4{ }^{\circ} \mathrm{C}$ for 12 hours. The ensuing precipitate was collected and recrystallized from chloroform affording $N$-nitrophthalimide as a white solid in $50 \%(8.16 \mathrm{~g})$ yield.

Physical state: white solid (m.p. $205{ }^{\circ} \mathrm{C}$, decomposition); ${ }^{1} \mathbf{H}$ NMR ( 300 MHz , Acetonitrile-d $\mathrm{d}_{3}$ ) $\delta 8.07-$ 7.90 (m, 4H); ${ }^{13} \mathbf{C}$ NMR ( 75 MHz , Acetonitrile- $\mathrm{d}_{3}$ ) $\delta 159.5,137.5,129.3$, 126.1; IR 1750, 1598, 1578, $1465,1242,1208,1164,1132,1106,1058,1009,906,858,798,787,771,744,695,666,553,532,438$.

$N-$ Nitrosaccharin (IV): ${ }^{4}$ In a 250 mL three necked round bottom flask equipped with a dropping funnel, air outlet and stirring bar was placed saccharin ( $10.0 \mathrm{~g}, 54.64 \mathrm{mmol}$ ) in acetic anhydride ( $25.7 \mathrm{~mL}, 0.27$ $\mathrm{mol})$. The solution was cooled to $0-5^{\circ} \mathrm{C}$ with an ice-bath and fuming concentrated nitric acid ( $99.5 \%$ from Sigma Aldrich) ( $25.1 \mathrm{~mL}, 0.61 \mathrm{~mol}$ ) was added dropwise to the solution during 30 minutes, while dry air was bubbled through the solution rapidly in order to remove excess nitrogen oxides. Saccharin completely dissolved once all nitric acid was added. The cooling bath was removed and the reaction mixture was stirred at room temperature during at least 4-6 hours with continuous bubbling of air through the liquid. The precipitate which had formed during the reaction was collected on a sintered glass filter and dried under high vacuum until dryness ( $11.8 \mathrm{~g}, 95 \%$ yield). Crystallization is possible from 1,4-dioxane or acetonitrile (long boiling time in these solvents can lead to partial decomposition of $N$-nitrosaccharin). The mother liquor was quenched with a cold solution of 1 N NaOH .

### 2.2 Development of reaction conditions (a) for the nitration of phenylboronic acid

An oven-dried, 5 mL micro-vial was charged on the benchtop with a magnetic pTFE-coated stirbar, reagent, and photocatalyst ( $\mathrm{x} \mathrm{mol} \%$ ). The vial was sealed and the atmosphere was cycled 3 x with $\mathrm{Ar} / \mathrm{vac}$. phenylboronic acid (1a) ( $30.5 \mathrm{mg}, 0.25 \mathrm{mmol}, 1.00$ equiv) and anhydrous solvent ( 1 mL ) was added with a plastic 1 mL syringe and then sparged with argon for 5 minutes. The reaction mixture was stirred and irradiated in the photoreactor at ambient conditions for 19 h . An internal standard of $n$-decane ( $48 \mu \mathrm{~L}, 1.00$ equiv) was added with a microsyringe. An aliquot was analyzed by GC-MS to obtain the calibrated yields and characterization for the desired product.

An internal standard of $n$ decane ( $97.5 \mu \mathrm{~L}, 0.5 \mathrm{mmol}, 1.0$ equivalent) was added via a microsyringe, and the vial was vigorously agitated to ensure homogenous mixture. The vial was opened, an aliquot ( 0.2 mL ) was filtered through a silica gel plug and rinsed with $\mathrm{MeCN}(2 \mathrm{~mL})$. The yield was determined using GC-MS with $n$-decane as internal standard following calibration.

### 2.4 General procedure (GP) $a$ for the photocatalytic ipso-nitration

A $10-\mathrm{mL}$ glass microwave vial was charged with $N$-nitrosuccinimide II ( $1 \mathrm{mmol}, 2.00$ equiv), and photocatalyst ( $2.5 \mathrm{~mol} \%$ ). The contents of the vial were then subject to 3 x argon/vacuum cycles. Anhydrous $\mathrm{CH}_{3} \mathrm{CN}$ was added and the reaction mixture was sparged for 5 min with argon. Finally, the substrate was introduced to the reaction mixture. The obtained red solution was stirred at room temperature under blue LED irradiation. After 19 hours, water was added to the reaction mixture and the product was extracted with DCM ( $3 \times 10 \mathrm{~mL}$ ). The solvent was removed under reduced pressure, and the crude product were subsequently purified by flash column chromatography over silica gel (hexane/EA $=50: 1$ ).

### 2.5 General procedure (GP) b for ipso-nitration in HFIP

mmol, 1.3 equiv) on a bench. The vial was closed with a cap with septum using a crimper, connected to a Schlenk line via a needle, evacuated for 5 min and then backfilled with Ar. HFIP ( $2 \mathrm{~mL}, 0.5 \mathrm{M}$ ) was added, and the reaction was stirred at $60^{\circ} \mathrm{C}$ in a metal heat block until complete consumption of aryl boronic acid. The vial was cooled to room temperature and the crude residue was concentrated on silica gel under reduced pressure ( $40{ }^{\circ} \mathrm{C}$, 200 mbar ). The product was purified by automated flash column chromatography as indicated.

### 2.6 Characterization data of nitro(hetero)arenes 2a-2an

Nitrobenzene (2a): According to GP $a, N$-nitrosuccinimide ( $1.0 \mathrm{mmol}, 2.00$ equiv), phenylboronic acid ( $0.5 \mathrm{mmol}, 1.00$ equiv), $\left[\mathrm{Ru}(\mathrm{bpy})_{3}\right]\left(\mathrm{PF}_{6}\right)_{2}(2.5 \mathrm{~mol} \%)$ and $\mathrm{MeCN}(2.0 \mathrm{~mL})$ were added to a $10-\mathrm{mL}$ vial. The reaction was irradiated with blue LEDs as described in Section 2.4. Compound 2a was isolated as a yellow oil $87 \%$ ( 54 mg ). ### 2.7 Nitration of arylboronic acids: gram-scale reaction

A 50 mL flame-dried Schlenk flask equipped with a stirbar was charged (4-bromophenyl)boronic acid 10 ( $2.0 \mathrm{~g}, 10 \mathrm{mmol}, 1.0$ equiv) and $\mathbf{I V}(3.0 \mathrm{~g}, 13 \mathrm{mmol}, 1.3$ equiv). The flask evacuated for 5 min and then backfilled with Ar. HFIP ( $10 \mathrm{~mL}, 1 \mathrm{M}$ ) was added, the tap was closed and the reaction was stirred as a suspension for 16 h at $60^{\circ} \mathrm{C}$. The solvent was removed under reduced pressure $\left(40^{\circ} \mathrm{C}, 200 \mathrm{mbar}\right)$ to give a yellow solid. $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ was added, and the mixture was sonicated for 2 min . The solid was collected on a glass frit, washed thoroughly with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and dried on high vacuum to give pure saccharin (IVc) as a white solid ( 1.96 g ). The filtrate (yellow solution) was loaded onto silica gel and purified by automated flash column chromatography (hexane; after complete elution of 1-bromo-4-nitrobenzene $\mathbf{2 0}$, the gradient was increased to $40 \%$ EtOAc in hexane to elute remaining saccharin). Saccharin obtained after column chromatography was washed $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to give a white solid ( 0.31 g ). 1-Bromo-4-nitrobenzene $\mathbf{2 0}$ was obtained as an off-white solid ( $1.91 \mathrm{~g}, 95 \%$ ).

### 2.8 Mechanistic studies

### 2.8.1 Effect of radical scavengers on ipso-nitration of 10 in HFIP

An oven-dried crimp cap microvial equipped with a magnetic stirrer was cooled down to rt under high vacuum, filled with argon and charged with arylboronic acid $\mathbf{1 0}$ ( $1 \mathrm{mmol}, 1.0$ equiv) and IV ( $296 \mathrm{mg}, 1.3$ mmol, 1.3 equiv) on a bench. The vial was closed with a cap with septum using a crimper, connected to a Schlenk line via a needle, evacuated for 5 min and then backfilled with Ar. Radical scavenger ( 1.3 mmol , 1.3 equiv, $)$ in HFIP ( $2 \mathrm{~mL}, 0.5 \mathrm{M}$ ) was added, and the reaction was stirred at $60^{\circ} \mathrm{C}$ in a metal heat block for 17 hours. The vial was cooled to room temperature and the crude residue was concentrated on silica gel under reduced pressure ( $40{ }^{\circ} \mathrm{C}$, 200 mbar ). The product was purified by automated flash column chromatography as indicated.

${ }^{a}$ Reaction conditions: $\mathbf{1 o}$ ( $1 \mathrm{mmol}, 1$ equiv), IV ( 1.3 equiv 0.65 mmol ), radical scavenger ( 1.3 equiv), HFIP ( 2 mL ). ${ }^{b}$ Isolated yield.

### 2.8.2 Nitration of triphenylboroxine with IV in HFIP

Experiment 1: triphenylboroxine ( $0.17 \mathrm{mmol}, 1.0$ equiv), IV ( $0.65 \mathrm{mmol}, 3.8$ equiv), HFIP ( 1 mL ), $34 \%$ of $\mathbf{2 a}, 22 \%$ of 2a'; experiment 2: triphenylboroxine ( $0.17 \mathrm{mmol}, 1.0$ equiv), IV ( $0.65 \mathrm{mmol}, 3.8$ equiv), HFIP ( 1 mL ), $\mathrm{MgSO}_{4}$ (2 equiv), $\mathbf{3 8 \%}$ of $\mathbf{2 a}, \mathbf{2 4 \%}$ of $\mathbf{2 a}$. Yields were determined by GC and GC-MS using $n$-decane as internal standard. Addition of water in the end of the reaction had no effect on yields of $\mathbf{2 a}$ and $\mathbf{2 a} \mathbf{a}^{\prime}$.

### 2.8.3 Density Functional Theory (DFT) calculations

All DFT calculations were performed with the Gaussian09 program package (Revision D.01). ${ }^{5}$ The structures of all minima and transition states were fully optimized using the hybrid density functional M06$2 \mathrm{X}^{6}$ with the ultrafine pruned $(99,590)$ grid. The $6-311 \mathrm{G}++(2 \mathrm{df}, 2 \mathrm{pd})$ (or $6-311 \mathrm{G}++(\mathrm{d}, \mathrm{p})$ where expressly stated) Pople basis set ${ }^{7}$ was used for all the atoms. The implicit solvation model IEF-PCM was used as implemented in Gaussian, applying all the parameters of 2-propanol, apart from the dielectric constant $(\varepsilon)$, which was modified to 16.70 (HFIP) ${ }^{8}$ according to the literature for the description of HFIP as solvent ${ }^{9,3}$ (or acetonitrile where expressly stated). Stationary points were characterized by vibrational analysis (only real frequencies for minima, one imaginary frequency for transition states (TSs)), and intrinsic reaction coordinate (IRC) calculations were carried out on the TSs in order to confirm their correct identification. Computed harmonic frequencies were used to calculate the thermal contribution to Gibbs free energy at 298 K and 1 atm . TSs were modelled according to the literature by substitution of benzene with phenyl boronic acid for nitrating agents (III and IV). Gibbs free energies and energies (G and E) are reported in Hartree, imaginary frequencies (v) are reported in $\mathrm{cm}^{-1}$.
