${ }^{1} \mathrm{H}(400 \mathrm{MHz}),{ }^{1} \mathrm{H}(500 \mathrm{MHz}),{ }^{13} \mathrm{C}(100 \mathrm{MHz}),{ }^{13} \mathrm{C}(126 \mathrm{MHz}) \mathrm{NMR}$ and ${ }^{19} \mathrm{~F}(376 \mathrm{MHz})$ NMR spectra are acquired on a Bruker Avance Ultrashield $400 \mathrm{MHz}, 500 \mathrm{MHZ}$ and a Bruker DPX $400 \mathrm{MHz}, 500 \mathrm{MHZ}$ spectrometer. Mass Spectroscopy (MS) and High Resolution Mass Spectroscopy (HR-MS) are performed on a Thermo Scientific LTQ-FT Ultra (ESI), The LTQ FT Ultra (Thermo) is a linear ion trap with a Fourier Transform Ion Cyclotron Resonance (FT-ICR) MS detector. The ICR analyzer is based on a 7 Tesla superconducting magnet. The instrument is coupled online to an analytical HPLC (UltiMate 3000 HPLC system, Dionex). The elemental analysis data are acquired on a Fast Sequential Atomic Absorption Spectrometer, VARIAN, AA280FS. IR spectra are recorded on a Varian FTIR-670 spectrometer using a GladiATR accessory with a diamond ATR element. Melting points are determined on a MPM-H2 apparatus. Anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, THF and $\mathrm{CH}_{3} \mathrm{CN}$ are obtained from a M. Braun SPS purification system. Anhydrous MeOH is prepared using $\mathrm{CaH}_{2}$ as drying agent. Anhydrous acetone is prepared using $\mathrm{CaCl}_{2}$ as drying agent.

Reaction setup
The photoreaction is conducted in a borosilicate glass vessel made by Synthware®. For technical information on this glass, the reader is directed to the homepage of the manufacturer: http://www.xinweier.com/
The distance from the irradiation source to the irradiation vessel is about 5-7 cm . A typical reaction setup is shown as below.

## X-ray Crystallographic Details

The crystal samples were prepared by dissolving the respective compounds in ethyl acetate/n-hexane solvent system. The solvent was placed in the refrigerator, the crystals were grown by slow cooling
Data were collected on a single crystal x-ray diffractometer equipped with a CMOS detector (Bruker APEX III, к-CMOS), an IMS microsource with MoK $\alpha$ radiation ( $\lambda=0.71073 \AA$ ) and a Helios optic using the APEX3 software package. ${ }^{1}$ Measurements were performed on single crystals coated with perfluorinated ether. The crystals were fixed on top of a kapton micro sampler and frozen under a stream of cold nitrogen. A matrix scan was used to determine the initial lattice parameters. Reflections were corrected for Lorentz and polarisation effects, scan speed, and background using SAINT. ${ }^{2}$ Absorption correction, including odd and even ordered spherical harmonics was performed using SADABS. ${ }^{3}$ Space group assignment was based upon systematic absences, E statistics, and successful refinement of the structure. The structures were solved using SHELXS or SHELXT with the aid of successive difference Fourier maps, and were refined against all data using SHELXL in conjunction with SHELXLE., 4,5,6 Hydrogen atoms were calculated in ideal positions as follows: Methyl hydrogen atoms were refined as part of rigid rotating groups, with a C-H distance of $0.98 \AA$ and $U_{\text {iso }(H)}=1.5 \cdot \mathrm{U}_{\text {eq(C) }}$. Other H atoms were placed in calculated positions and refined using a riding model, with methylene and aromatic $\mathrm{C}-\mathrm{H}$ distances of $0.99 \AA$ and $0.95 \AA$, respectively, and other $\mathrm{C}-\mathrm{H}$ distances of $1.00 \AA$, all with $\mathrm{U}_{\text {iso(H) }}=$ 1.2. $\mathrm{U}_{\text {eq( }}(\mathrm{C}$. Non-hydrogen atoms were refined with anisotropic displacement parameters. Full-matrix least-squares refinements were carried out by minimizing $\Sigma w\left(F_{o}{ }^{2}-F_{c}{ }^{2}\right)^{2}$ with the SHELXL weighting scheme. ${ }^{4}$ Neutral atom scattering factors for all atoms and anomalous dispersion corrections for the non-hydrogen atoms were taken from International Tables for Crystallography. ${ }^{7}$ A split layer refinement was used for disordered groups and additional SIMU, DELU, RIGU, ISOR and SAME restraints were used, if necessary. The unit cell of $2 r$ contains 1.5 (not fully occupied sites) disordered molecules of hexane which was treated as a diffuse contribution to the overall scattering without specific atom positions using the PLATON/SQUEEZE procedure. ${ }^{8}$ Images of the crystal structures were generated with PLATON. ${ }^{9}$ Crystallographic data are provided free of charge by The Cambridge Crystallographic Data Centre.
