Supporting Information contains 43 pages, 5 tables, 1 figure, and 2 appendices.

Contents

Table S1. The variance for each hypothetical PM _{2.5} concentration distribution with mean annual concentrations ranging from the counterfactual (2.0 µg/m ³) to the mean reported in each study at 0.1 µg/m ³ increments.....	S3
Table S2A. Hazard ratios (HR) and standard and hybrid 95% confidence intervals (CIs) applied to Pinault et al. 2017 and Di et al. 2017 for mean annual PM _{2.5} concentrations ranging from the counterfactual (2.0 µg/m ³) to the study means at 0.1 µg/m ³ increments.....	S13
Table S2B. Hazard ratios (HR) and standard and hybrid 95% confidence intervals (CIs) applied to Hart et al. 2015 and Turner et al. 2016 for mean annual PM _{2.5} concentrations ranging from the counterfactual (2.0 µg/m ³) to the study means at 0.1 µg/m ³ increments.....	S16
Table S2C. Hazard ratios (HR) and standard and hybrid 95% confidence intervals (CIs) applied to Cesaroni et al. 2013 and Yin et al. 2017 for mean annual PM _{2.5} concentrations ranging from the counterfactual (2.0 µg/m ³) to the study means at 0.1 µg/m ³ increments.....	S19
Table S3. Standard error adjustment factors for hypothetical concentration distributions with mean annual PM _{2.5} concentrations ranging from the counterfactual (2.0 µg/m ³) to the mean reported in each study at 0.1 µg/m ³ increments.....	S29
Table S4. Population-weighted mean and variance of 2014 U.S. PM _{2.5} concentrations and hypothetical rollback scenarios.	S38
Table S5A. Comparison of population attributable fractions (PAF) and 95% confidence intervals (CI) using standard and hybrid uncertainty methods when rolling back 2014 U.S. population-weighted annual PM _{2.5} concentrations by incremental percentages ranging from 10 to 90%. Estimates derived from Pinault et al. (2017), Di et al. (2017), and Hart et al. (2015).....	S39
Table S5B. Comparison of population attributable fractions (PAF) and 95% confidence intervals (CI) using standard and hybrid uncertainty methods when rolling back 2014 U.S. population-weighted annual PM _{2.5} concentrations by incremental percentages ranging from 10 to 90%. Estimates derived from Turner et al. (2016), Cesaroni et al. (2013), and Yin et al. (2017).....	S40
Figure S1. Ratio of hybrid and standard 95% confidence intervals (CIs) for population attributable fractions (PAF) when rolling back 2014 U.S. population-weighted annual PM _{2.5} concentrations by incremental percentages ranging from 10 to 90%.....	S41
Appendix 1. R code for calculating the variance of hypothetical PM _{2.5} distributions.....	S42
Appendix 2. R code for calculating hybrid uncertainty estimates.	S43

Table S1. The variance for each hypothetical PM_{2.5} concentration distribution with mean annual concentrations ranging from the counterfactual (2.0 µg/m³) to the mean reported in each study at 0.1 µg/m³ increments.

^aPinault et al. 2017 mean annual concentration, above which the hybrid and standard 95% CIs are equal.

^bDi et al. 2017 mean annual concentration, above which the hybrid and standard 95% CIs are equal.

Note: HR calculations are anchored to 2.0 µg/m³, such that the increment used to calculate HRs at each mean annual PM_{2.5} concentration is equivalent to the mean concentration minus 2.0. If you standardize the HR at each mean concentration to a 10 µg/m³ increase, as is done in most long-term PM_{2.5} exposure and mortality epidemiologic studies, the HR is equal to standardized HR reported in the respective study for all hypothetical mean annual PM_{2.5} concentrations.

Table S2B. Hazard ratios (HR) and standard and hybrid 95% confidence intervals (CIs) applied to Hart et al. 2015 and Turner et al. 2016 for mean annual PM_{2.5} concentrations ranging from the counterfactual (2.0 µg/m³) to the study means at 0.1 µg/m³ increments.

PM _{2.5}	Hart et al. (2015)			Turner et al. (2016)

^aHart et al. 2015 mean annual concentration, above which the hybrid and standard 95% CIs are equal.

^bTurner et al. 2016 mean annual concentration, above which the hybrid and standard 95% CIs are equal.

Note: HR calculations are anchored to 2.0 $\mu\text{g}/\text{m}^3$, such that the increment used to calculate HRs at each mean annual $\text{PM}_{2.5}$ concentration is equivalent to the mean concentration minus 2.0. If you standardize the HR at each mean concentration to a 10 $\mu\text{g}/\text{m}^3$ increase, as is done in most long-term $\text{PM}_{2.5}$ exposure and mortality epidemiologic studies, the HR is equal to standardized HR reported in the respective study for all hypothetical mean annual $\text{PM}_{2.5}$ concentrations.

Table S2C. Hazard ratios (HR) and standard and hybrid 95% confidence intervals (CIs) applied to Cesaroni et al. 2013 and Yin et al. 2017 for mean annual PM_{2.5} concentrations ranging from the counterfactual (2.0 µg/m³) to the study means at 0.1 µg/m³ increments.

PM _{2.5}	Cesaroni et al. (2013)			Yin et al. (2016)

40.6^b	1.163	(1.121, 1.207)	---	1.395	(1.370, 1.420)	(1.370, 1.420)

^aCesaroni et al. 2013 mean annual concentration, above which the hybrid and standard 95% CIs are equal.

^bYin et al. 2017 mean annual concentration, above which the hybrid and standard 95% CIs are equal.

Note: HR calculations are anchored to 2.0 µg/m³, such that the increment used to calculate HRs at each mean annual PM2.5 concentration is equivalent to the mean concentration minus 2.0. If you standardize the HR at each mean concentration to a 10

$\mu\text{g}/\text{m}^3$ increase, as is done in most long-term PM2.5 exposure and mortality epidemiologic studies, the HR is equal to standardized HR reported in the respective study for all hypothetical mean annual PM2.5 concentrations.

Table S3. Standard error adjustment factors for hypothetical concentration distributions with mean annual PM_{2.5} concentrations ranging from the counterfactual (2.0 µg/m³) to the mean reported in each study at 0.1 µg/m³ increments.

Table S4. Population-weighted mean and variance of 2014 U.S. PM_{2.5} concentrations and hypothetical rollback scenarios.

Air Quality	Mean ($\mu\text{g}/\text{m}^3$)	Var ($[\mu\text{g}/\text{m}^3]^2$)
Baseline ¹	8.3	3.1
10% Rollback	7.5	2.5
20% Rollback	6.6	2.0
30% Rollback	5.8	1.5
40% Rollback	5.0	1.1
50% Rollback	4.2	0.8
60% Rollback	3.3	0.5
70% Rollback	2.5	0.2
80% Rollback	2.03	0.01
90% Rollback	2.0	0.0

¹Baseline distribution is a national distribution of PM_{2.5} concentrations in the contiguous U.S. for the year 2014. PM_{2.5} concentrations were predicted by combining PM_{2.5} information from national air quality monitoring networks and Community Multiscale Air Quality (CMAQ v 4.7)

Table S5A. Comparison of population attributable fractions (PAF) and 95% confidence intervals (CI) using standard and hybrid uncertainty methods when rolling back 2014 U.S. population-weighted annual PM_{2.5} concentrations by incremental percentages ranging from 10 to 90%. Estimates derived from Pinault et al. (2017), Di et al. (2017), and Hart et al. (2015).

Notes: ACS = American Cancer Society's Cancer Prevention Study II; CI = confidence interval; LCL = lower confidence limit; NCCM = the National Cohort of Chinese Men; PAF = population attributable fraction; RoLS = the Rome Longitudinal Study; UCL = upper confidence limit.

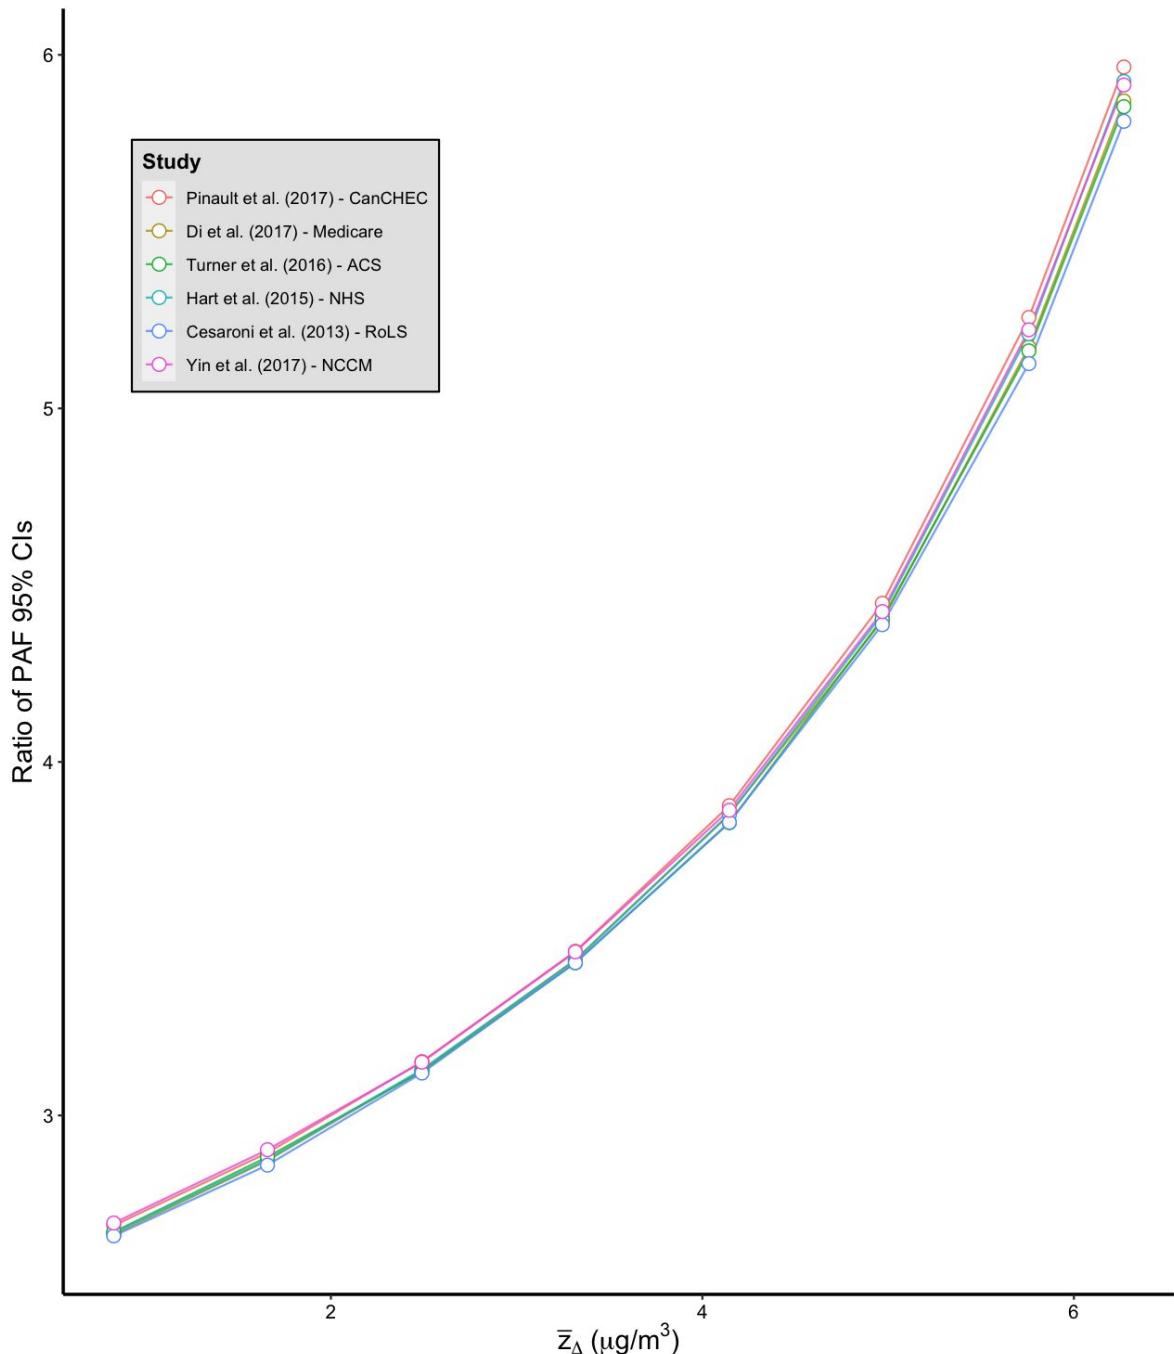

Figure Note: \bar{z}_Δ is the difference between population-weighted mean of a given rollback scenario (z_t) and the population-weighted mean of the 2014 baseline concentration distribution (z_c).

Figure S1. Ratio of hybrid and standard 95% confidence intervals (CIs) for population attributable fractions (PAF) when rolling back 2014 U.S. population-weighted annual PM_{2.5} concentrations by incremental percentages ranging from 10 to 90%.

Appendix 1. R code for calculating the variance of hypothetical PM_{2.5} distributions.

This R code estimates the variance of hypothetical PM_{2.5} concentration distributions with mean annual PM_{2.5} concentrations defined in 0.1 µg/m³ increments. This sample code includes the observed annual PM_{2.5} concentration distribution mean and variance from Turner et al. (2016).

```
#specify the counterfactual concentration (cf)
cf=2.0
#specify the maximum PM2.5 concentration (maxcon) reported in the study
maxcon=27.9
#specify mean of PM2.5 exposure distribution (a) in cohort; this is  $m_{obs}$  in Section 2.1
a=12.6
#specify variance of PM2.5 exposure distribution (b) in cohort; this is  $\nu_{obs}^2$  in Section 2.1
b=8.41
#determine mean of log-normal PM2.5 distribution (mu); this is  $\mu_{obs}$  in Section 2.1
mu=-0.5*log((b+a^2)/a^4)
#determine variance of log-normal PM2.5 distribution (sigma2); this is  $\sigma_{obs}^2$  in Section 2.1
sigma2=2*(log(a)-mu)
#determine ratio of variance to mean (gamma); this is  $\alpha_{obs}$  in Section 2.1
gamma=sigma2/mu
#define hypothetical means ranging from the counterfactual to the maximum concentration in 2.1
#µg/m3 increments; this is  $m_{new}$  in Section 2.1
newa=seq(cf, a, 0.1)
#determine new value of mu (newmu) based on ratio gamma; this is  $\tilde{\mu}$  in Section 2.1
newmu=log(newa)/(1+gamma/2)
#determine new variance (newb) for each new mean based on newmu and gamma;
# this is  $\nu_{new}^2$  in Section 2.1
newb=(exp(gamma*newmu)-1)*exp(2*newmu+gamma*newmu)
```

Appendix 2. R code for calculating hybrid uncertainty estimates.

This R code applies the variance of hypothetical PM_{2.5} concentration distributions calculated in Appendix 1 to estimate hybrid 95% CIs. This code includes an effect estimate and standard error reported in Turner et al. (2016) and should be appended to, and executed in conjunction with, the R code for calculating the variance of hypothetical PM_{2.5} distributions (Appendix 1).

```
#calculate beta from the reported HR
beta=log(1.07)/10
#calculate the standard error of beta from the reported 95% CIs
