## Chemical Synthesis

Scheme S1. Synthesis of 4-bromophenyl intermediates for bicyclic piperidine substitutions of $\mathbf{1}$ and $\mathbf{2}$.

Reagents and Conditions: (a) $\mathrm{AcOH}, \mathrm{Br}_{2}$, reflux, $4.5 \mathrm{~h}, 72 \%$; b) $\mathrm{Et}_{2} \mathrm{Zn}, \mathrm{CH}_{2} \mathrm{I}_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, Ar , rt, overnight, $62 \%$; (c) $(\mathrm{Boc})_{2} \mathrm{O}, \mathrm{TEA}, \mathrm{DCM}, 0^{\circ} \mathrm{C}$ to rt, $2 \mathrm{~h}, 78-81 \%$; (d) $\mathrm{TMSCF}_{3}, \mathrm{NaI}, \mathrm{THF}, 65^{\circ} \mathrm{C}$, overnight, $16 \%$.

Scheme S2. Carboxylate substitutions on the central phenyl ring of $\mathbf{2}$.

Reagents and Conditions: (a) $\mathrm{NH}_{4} \mathrm{Cl}$, HATU, DIPEA, DMF, rt, $1 \mathrm{~h}, 99 \%$; (b) $\left(\mathrm{CF}_{3} \mathrm{CO}\right)_{2} \mathrm{O}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DCM}, \mathrm{rt}$, $1 \mathrm{~h}, 76 \%$; (c) TFA:THF $=2: 1, \mathrm{rt}, 0.5 \mathrm{~h}, 72 \%$ (15) or $87 \%$ (16).

## Synthetic procedures

## Preparation of $\mathbf{P} 2 \mathrm{Y}_{14} \mathbf{R}$ antagonist intermediates for Suzuki coupling (Scheme S1)

4-(4-Bromophenyl)quinuclidine (96). Bromine ( 2 mL ) was added to a stirred solution of 4-phenylquinuclidine $\mathbf{9 5}(375 \mathrm{mg}, 2 \mathrm{mmol})$ in AcOH ( 35 mL ). The mixture was refluxed in a $140^{\circ} \mathrm{C}$ oil bath for 4.5 h . The reaction residue was cooled to rt and basified with 6 N NaOH and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ three times. The combined organic layer was dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The volatiles were evaporated and the residue was column chromatographed $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} / \mathrm{TEA}, 100: 0: 1 \rightarrow 85: 15: 1\right)$ and further purified on RP$\operatorname{HPLC}\left(t_{\mathrm{R}}=23 \mathrm{~min} ; \mathrm{C} 18 ; \mathrm{A}: \mathrm{ACN}, \mathrm{B}: 0.2 \%\right.$ TFA in $\mathrm{H}_{2} \mathrm{O} ; 30 \% \mathrm{~A} \rightarrow 60 \% \mathrm{~A}$ in 40 min , flow rate $=5 \mathrm{~mL} / \mathrm{min}$ ) to give 96 as a white solid ( $384 \mathrm{mg}, 72 \%$ ): ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.53(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.31(\mathrm{~d}$, $J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.90(\mathrm{t}, J=7.4 \mathrm{~Hz}, 6 \mathrm{H}), 2.21(\mathrm{t}, J=7.2 \mathrm{~Hz}, 6 \mathrm{H}) ;$ HRMS m$/ \mathrm{z}[\mathrm{M}+\mathrm{H}]^{+}$for $\mathrm{C}_{13} \mathrm{H}_{17} \mathrm{BrN}$ calculated 266.0539, found 266.0541 .

6-(4-Bromophenyl)-3-azabicyclo[4.1.0]heptane (98). A 25 mL round-bottom flask was flamed dried under argon and charged with 4-(4-bromophenyl)-1,2,3,6-tetrahydropyridine 97 ( $95.2 \mathrm{mg}, 0.4 \mathrm{mmol}$ ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$
$(4 \mathrm{~mL})$. Into the solution cooled in ice bath was added diethylzinc ( 1 M in hexane, $1 \mathrm{~mL}, 1 \mathrm{mmol}$ ). The mixture was stirred at $0^{\circ} \mathrm{C}$ for 30 min and then diiodomethane ( $161.1 \mu \mathrm{~L}, 535.7 \mathrm{mg}, 2 \mathrm{mmol}$ ) was added. The resulting mixture was stirred at $0^{\circ} \mathrm{C}$ for 1.5 h and then at rt overnight. The reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution and then basified with $\mathrm{NaHCO}_{3}$ solution and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ three times. The combined organic layer was dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The volatiles were evaporated and the residue was column chromatographed $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} / \mathrm{TEA}, 100: 0: 1 \rightarrow 95: 5: 1\right)$ to give $\mathbf{9 8}$ as transparent oil ( 62.8 mg , $62 \%$ ): ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.38(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.20(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 5.96(\mathrm{~s}, 1 \mathrm{H}), 3.60-$ $3.55(\mathrm{~m}, 1 \mathrm{H}), 3.12(\mathrm{~d}, J=13.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.05-2.95(\mathrm{~m}, 1 \mathrm{H}), 2.75-2.69(\mathrm{~m}, 1 \mathrm{H}), 2.24-2.09(\mathrm{~m}, 2 \mathrm{H}), 1.36-1.31$ $(\mathrm{m}, 1 \mathrm{H}), 1.08-1.05(\mathrm{~m}, 1 \mathrm{H}), 0.92(\mathrm{t}, \mathrm{J}=5.3 \mathrm{~Hz}, 1 \mathrm{H}) . \mathrm{HRMS} \mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{H}]^{+}$for $\mathrm{C}_{12} \mathrm{H}_{15} \mathrm{BrN}$ calculated 252.0382, found 252.0387 .

N-Boc-6-(4-bromophenyl)-3-azabicyclo[4.1.0]heptane (99). To a solution of 98 ( $62.8 \mathrm{mg}, 0.25 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.5 \mathrm{~mL})$ was added TEA ( $\left.123 \mu \mathrm{~L}, 89 \mathrm{mg}, 0.88 \mathrm{mmol}\right)$ and $(\mathrm{Boc})_{2} \mathrm{O}(71.2 \mathrm{mg}, 0.33 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$. The resulting solution was stirred at rt for 2 h . The reaction was quenched with $\mathrm{NaHCO}_{3}$ solution and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ three times. The combined organic layer was dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The volatiles were evaporated and the residue was column chromatographed (hexane/EtOAc, 100:0 $\rightarrow 90: 10$ ) to give $\mathbf{9 9}$ as a white solid ( $68.5 \mathrm{mg}, 78 \%$ ): ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.38(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}$ ), $7.10(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}$ ), $3.80-3.71(\mathrm{~m}, 2 \mathrm{H}), 3.40-3.34(\mathrm{~m}, 1 \mathrm{H}), 3.25-3.19(\mathrm{~m}, 1 \mathrm{H}), 2.10-2.04(\mathrm{~m}, 2 \mathrm{H}), 1.46(\mathrm{~s}, 9 \mathrm{H}), 1.39-1.30(\mathrm{~m}$, $1 \mathrm{H}), 0.954(\mathrm{dd}, J=5.2,8.9 \mathrm{~Hz}, 1 \mathrm{H}), 0.83(\mathrm{t}, J=5.3 \mathrm{~Hz}, 1 \mathrm{H}) . \mathrm{MS} \mathrm{m} / \mathrm{z}[\mathrm{M}-\mathrm{t} \text {-butyl+2H}]^{+}$for $\mathrm{C}_{13} \mathrm{H}_{15} \mathrm{BrNO}_{2}$ calculated 296.0, found 296.0.

N-Boc-4-(4-bromophenyl)-1,2,3,6-tetrahydropyridine (100). To a solution of 97 ( $102.4 \mathrm{mg}, 0.43 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \mathrm{~mL})$ was added TEA $(212 \mu \mathrm{~L}, 153 \mathrm{mg}, 1.5 \mathrm{mmol})$ and $(\mathrm{Boc})_{2} \mathrm{O}(122 \mathrm{mg}, 0.57 \mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$. The resulting solution was stirred at rt for 2 h . The reaction was quenched with $\mathrm{NaHCO}_{3}$ solution and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ three times. The combined organic layer was dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The volatiles were evaporated and the residue was column chromatographed (hexane/EtOAc, 100:0 $\rightarrow 90: 10$ ) to give $\mathbf{1 0 0}$ as a white solid ( $117 \mathrm{mg}, 81 \%$ ): ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.42(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.21(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H})$, 6.01 ("s", 1H), 4.05 ("s", 2H), 3.62 (t, J=5.5 Hz, 2H), 2.47 ("s", 2H), 1.48 (s, 9H).

N-Boc-7,7-difluoro-6-(4-bromophenyl)-3-azabicyclo[4.1.0]heptane (101). To a solution of $\mathbf{1 0 0}$ ( 169 mg , 0.5 mmol ) in THF ( 3 mL ) in a pressure tube was added $\mathrm{NaI}(37.5 \mathrm{mg}, 0.25 \mathrm{mmol})$ and $\mathrm{TMSCF}_{3}(369 \mu \mathrm{l}$, $710 \mathrm{mg}, 2.5 \mathrm{mmol}$ ). The reaction vessel was sealed and heated at $65^{\circ} \mathrm{C}$ overnight. The volatiles were evaporated and the residue was column chromatographed (hexane/EtOAc, $90: 10 \rightarrow 85: 15$ ) to give $\mathbf{1 0 1}$ as a white solid ( $31 \mathrm{mg}, 16 \%$ ): ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.48(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.15(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}$ ), 4.26-4.09 (m, 1H), 3.99-3.66 (m, 1H), 3.55-3.42 (m, 1H), 3.37-3.12 (m, 2H), 2.29-2.09 (m, 1H), 2.08-1.89 (m, 1H), 1.48 (s, 9H); ${ }^{19}$ F NMR $\delta-129.2$ (dd, $J=90,155.9 \mathrm{~Hz}, 1 \mathrm{~F}$ ), -145.2 (dd, $\left.J=149.6 \mathrm{~Hz}, 1 \mathrm{~F}\right)$. HRMS $\mathrm{m} / \mathrm{z}[\mathrm{M}-t \text {-butyl }+2 \mathrm{H}]^{+}$for $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{BrF}_{2} \mathrm{NO}_{2}$ calculated 332.0092, found 332.0103.

Synthesis of compound 15-16 for carboxylate substitutions on the central phenyl ring of 2 (Scheme S2)

4'-(Piperidin-4-yl)-5-(4-(4-(trifluoromethyl)phenyl)-1H-1,2,3-triazol-1-yl)-[1,1'-biphenyl]-3-carboxamide (15). Method B: Yield $72 \%$; HPLC purity $99 \%\left(\mathrm{R}_{\mathrm{t}}=9.29 \mathrm{~min}\right)$; ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right) \delta 9.23(\mathrm{~s}$, $1 \mathrm{H}), 8.42(\mathrm{~s}, 1 \mathrm{H}), 8.38(\mathrm{~s}, 1 \mathrm{H}), 8.29(\mathrm{~s}, 1 \mathrm{H}), 8.18(\mathrm{~d}, J=8.12 \mathrm{~Hz}, 2 \mathrm{H}), 7.83-7.80(\mathrm{~m}, 4 \mathrm{H}), 7.48(\mathrm{~d}, J=8.20$ $\mathrm{Hz}, 2 \mathrm{H}), 3.56(\mathrm{~d}, \mathrm{~J}=12.80 \mathrm{~Hz}, 2 \mathrm{H}), 3.22-3.15(\mathrm{~m}, 2 \mathrm{H}), 3.06-2.98(\mathrm{~m}, 1 \mathrm{H}), 2.17-2.14(\mathrm{~m}, 2 \mathrm{H}), 2.03-1.92$
(m, 2H); MS (ESI, m/z) $492.2[\mathrm{M}+1]^{+}$; ESI-HRMS calcd. $\mathrm{m} / \mathrm{z}$ for $\mathrm{C}_{27} \mathrm{H}_{25} \mathrm{~N}_{5} \mathrm{OF}_{3} 492.2011$, found 492.2013 $[\mathrm{M}+1]^{+}$.

4'-(Piperidin-4-yl)-5-(4-(4-(trifluoromethyl)phenyl)-1H-1,2,3-triazol-1-yl)-[1,1'-biphenyl]-3-carbonitrile (16). Method B: Yield 87\%; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ) $\delta 9.28(\mathrm{~s}, 1 \mathrm{H}), 8.55(\mathrm{~s}, 1 \mathrm{H}), 8.36(\mathrm{~s}, 1 \mathrm{H}), 8.19-$ $8.17(\mathrm{~m}, 3 \mathrm{H}), 7.83-7.82(\mathrm{~m}, 4 \mathrm{H}), 7.50(\mathrm{~s}, 1 \mathrm{H}), 7.49(\mathrm{~s}, 1 \mathrm{H}), 3.55(\mathrm{~d}, J=12.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.24-3.16(\mathrm{~m}, 2 \mathrm{H})$, 3.07-3.01 (m, 1H), $2.15(\mathrm{~d}, \mathrm{~J}=13.76 \mathrm{~Hz}, 2 \mathrm{H}), 2.03-1.93(\mathrm{~m}, 2 \mathrm{H})$; MS (ESI, m/z) $474.2[\mathrm{M}+1]^{+}$; ESI-HRMS calcd. $\mathrm{m} / \mathrm{z}$ for $\mathrm{C}_{27} \mathrm{H}_{23} \mathrm{~N}_{5} \mathrm{~F}_{3} 474.1906$, found $474.1912[\mathrm{M}+1]^{+}$.
tert-Butyl 4-(3'-carbamoyl-5'-(4-(4-(trifluoromethyl)phenyl)-1H-1,2,3-triazol-1-yl)-[1, 1'-biphenyl]-4-yl)piperidine-1-carboxylate (51). To a solution of compound $\mathbf{5 0}(47 \mathrm{mg}, 0.079 \mathrm{mmol}$; synthesized according to literature procedures reported) in dimethylformamide ( 3 mL ) were added $\mathrm{NH}_{4} \mathrm{Cl}(8.5 \mathrm{mg}, 0.159 \mathrm{mmol}$ ), HATU ( $45 \mathrm{mg}, 0.119 \mathrm{mmol}$ ) and $N, N$-diisopropylethylamine ( $20 \mathrm{mg}, 28 \mu 1,0.159 \mathrm{mmol}$ ) and then this reaction mixture was stirred at room temperature for 1 h . This mixture was partitioned ethyl acetate ( 6 mL ) and water ( 3 mL ). The aqueous layer was extracted with ethyl acetate ( $5 \mathrm{~mL} \times 2$ ), and then the combined organic layer was washed with brine ( 3 mL ), dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated under reduced pressure. The residue was purified by silica gel column chromatography (hexane:ethyl acetate=1:1) to afford compound $51(48 \mathrm{mg}, 99 \%)$ as a white solid; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.44(\mathrm{~s}, 1 \mathrm{H}), 8.27(\mathrm{~s}, 1 \mathrm{H}), 8.23$ (s, 1H), 8.11 (s, 1H), 8.07 (d, $J=8.04 \mathrm{~Hz}, 2 \mathrm{H}), 7.76(\mathrm{~d}, J=8.16 \mathrm{~Hz}, 2 \mathrm{H}), 7.66(\mathrm{~d}, J=8.24 \mathrm{~Hz}, 2 \mathrm{H}), 7.38(\mathrm{~d}$, $J=8.20 \mathrm{~Hz}, 2 \mathrm{H}), 4.31(\mathrm{~d}, J=13.68 \mathrm{~Hz}, 2 \mathrm{H}), 2.89-2.81(\mathrm{~m}, 2 \mathrm{H}), 2.80-2.73(\mathrm{~m}, 1 \mathrm{H}), 1.89(\mathrm{~d}, J=12.00 \mathrm{~Hz}$, 2 H ), 1.67 (merged with water peak), 1.51 (s, 9H); MS (ESI, M/Z) 536.1 [M+1-tert-butyl] ${ }^{+}, 592.2[\mathrm{M}+1]^{+}$; ESI-HRMS calcd. $\mathrm{m} / \mathrm{z}$ for $\mathrm{C}_{28} \mathrm{H}_{25} \mathrm{~N}_{5} \mathrm{O}_{3} \mathrm{~F}_{3} 536.1909$, found 536.1911 [M+1-tert-butyl] ${ }^{+}$.
tert-Butyl 4-(3'-cyano-5'-(4-(4-(trifluoromethyl)phenyl)-1H-1,2,3-triazol-1-yl)-[1,1'-biphenyl]-4-yl)piperidine-1-carboxylate (52). To a solution of compound $51(41 \mathrm{mg}, 0.069 \mathrm{mmol})$ in dichloromethane $(2 \mathrm{~mL})$ were added trifluoroacetic anhydride $(97 \mathrm{mg}, 64 \mu \mathrm{l}, 0.462 \mathrm{mmol})$ and triethylamine ( $50 \mathrm{mg}, 69 \mu \mathrm{l}$, 0.494 mmol ) at $0{ }^{\circ} \mathrm{C}$, and then this reaction mixture was stirred at room temperature for 1 h . This mixture was partitioned dichloromethane $(6 \mathrm{~mL})$ and water $(3 \mathrm{~mL})$. The aqueous layer was extracted with dichloromethane ( $5 \mathrm{~mL} \times 2$ ), and the organic layer was washed with brine ( 3 mL ), dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated under reduced pressure. The residue was purified by silica gel column chromatography (hexane:ethyl acetate $=4: 1$ ) to afford compound $52(30 \mathrm{mg}, 76 \%)$ as a white solid; ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 8.38(\mathrm{~s}, 1 \mathrm{H}), 8.31(\mathrm{t}, J=1.84 \mathrm{~Hz}, 1 \mathrm{H}), 8.07(\mathrm{~d}, J=8.08 \mathrm{~Hz}, 2 \mathrm{H}), 8.06-8.04(\mathrm{~m}, 1 \mathrm{H}), 7.96(\mathrm{t}, J$ $=1.42 \mathrm{~Hz}, 1 \mathrm{H}), 7.77(\mathrm{~d}, J=8.20 \mathrm{~Hz}, 2 \mathrm{H}), 7.62(\mathrm{~d}, J=8.28 \mathrm{~Hz}, 2 \mathrm{H}), 7.39(\mathrm{~d}, J=8.20 \mathrm{~Hz}, 2 \mathrm{H}), 4.31(\mathrm{~d}, J$ $=12.84 \mathrm{~Hz}, 2 \mathrm{H}), 2.89-2.83(\mathrm{~m}, 2 \mathrm{H}), 2.79-2.72(\mathrm{~m}, 1 \mathrm{H}), 1.89(\mathrm{~d}, J=12.04 \mathrm{~Hz}, 2 \mathrm{H}), 1.75-1.65(\mathrm{~m}, 2 \mathrm{H}), 1.52$ (s, 9H); MS (ESI, M/Z) 518.1 [M+1-tert-butyl] ${ }^{+}$; ESI-HRMS calcd. m/z for $\mathrm{C}_{28} \mathrm{H}_{23} \mathrm{~N}_{5} \mathrm{O}_{2} \mathrm{~F}_{3} 518.1804$, found 518.1801 [M+1-tert-butyl] ${ }^{+}$.

## Synthesis and analysis of $\left[{ }^{3} \mathrm{H}\right]$ PPTN $1(5 \mathbf{m C i})$

Synthetic procedure (refer to Scheme 5):
A, JYH-029 ( $\mathbf{3 9}, 6 \mathrm{mg}, 10 \mu \mathrm{~mol}$ ) was combined with $\mathrm{Pd} / \mathrm{C}(10 \%$ on charcoal, 5 mg$)$ in ethyl acetate ( 0.2 mL ). The reaction mixture was evacuated, and tritium gas was added. The mixture stirred for 24 h at room temperature. The reaction mixture was filtered through Acrodisc Syringe Filters, and the filtrate was evaporated with methanol 3 times and the compound $\mathbf{9 3}$ obtained subjected to assay.

B, 94, $\left[{ }^{3} \mathrm{H}\right]$ JYH-031 (93) was dissolved in 1 mL of THF, and 0.1 mL of TFA was added slowly and the mixture stirred for 4 h at room temperature. The reaction mixture was evaporated to dryness.

C, $\left[{ }^{3} \mathrm{H}\right] \mathbf{1},\left[{ }^{3} \mathrm{H}\right] \mathrm{JYH}-014(\mathbf{9 4})$ was slowly dissolved in 1 mL of water:methanol ( $1: 1$, by volume), and 0.1 mL 1 N KOH was added slowly and the mixture stirred for 18 h at room temperature. The reaction mixture was evaporated to dryness.

D, Purification of $\left[{ }^{3} \mathrm{H}\right] \mathbf{1}$ :
The residue from the last step was purified on an HPLC-C18 column, with a mobile phase gradient (A: $0.1 \%$ aqueous TFA, B: $100 \%$ acetonitrile) of $100 \%$ A to $100 \%$ B in 60 min , and flow rate of $6 \mathrm{~mL} / \mathrm{min}$, UV detection at 268 nm . The isolated material was demonstrated to be homogeneous in a radiochemical/HPLC assay.

MS Data Set

## Behavior of $\left[{ }^{3} \mathrm{H}\right]$ PPTN in solution and in interaction with cell membranes

$\left[{ }^{3} \mathrm{H}\right]$ PPTN was either precipitating or adhering to vessels during storage of the ethanol source solution and its aqueous dilution. We tried warming but there was no liberation of PPTN from the walls of the vessel. We compared the solubility of unlabeled PPTN ( HCl salt from Tocris), we compared a 100-fold dissolution from 5 mM DMSO stock into either pure EtOH , pure water, or a $1: 1$ mixture of EtOH and water. All three showed no visible signs of precipitation.

Aqueous [ $\left.{ }^{3} \mathrm{H}\right]$ PPTN tended to stick to plastic surfaces (very efficiently, within minutes, Figure S4 below), but not glass surfaces. See the plot below, in which aliquots were counted over time post-dilution from the EtOH stock and comparing keeping the diluted solution at room temperature in either glass and polypropylene tubes. The initial concentration in the aqueous medium (PBS) was 10 nM , diluted by 1000fold from the $10 \mu \mathrm{M}$ source solution.

Figure S4.

## A

## cpm changes after dilution using glass and plastic tubes

We compared the specific and non-specific binding of $\left[{ }^{3} \mathrm{H}\right]$ PPTN 1 to membranes of $\mathrm{P} 2 \mathrm{Y}_{14}$ receptorexpressing CHO cells, using our standard incubation protocol for GPCRs in general. The level of nonspecific binding was unacceptably high for reliable results (estimated at $>90 \%$ of the total radioactivity, figure below), even when the glass fiber filters used to separate bound from unbound label were pretreated with polyethyleneimine (a technique we have used successfully in some other difficult cases). We conclude that the radioligand, unfortunately, will not be useful for us to screen new drug compounds, at least using membrane preparations.

## Molecular modeling

Table S4. Summary of the MD trajectories analysis ( 5 replicates) of the complex between $\mathrm{hP} 2 \mathrm{Y}_{14} \mathrm{R}$ and compounds $\mathbf{1 7}$. The average root mean square deviation of the ligand heavy atoms relative to the docking pose ( $\mathrm{RMSD}_{\text {ave }}$ ), after alignment of the protein $\mathrm{C} \alpha$ atoms to the starting structure; the average ligand-receptor electrostatic (Ele), van der Waals (vdW) and sum of the two (Total) interaction energy ( $\mathrm{En}_{\text {ave }}$ ) are indicated. The percentages of frames showing hydrogen bonds between the ligand and Lys $77^{2.60}$, Tyr $102^{3.33}$, Lys $277^{7.35}$ are reported. The replicates discussed in the manuscript (selected on the basis of the lowest average ligand RMSD) are highlighted in red.

Figure S7.

Figure S7. Docking poses of A) compounds $\mathbf{1}$ (PPTN) (purple) and $\mathbf{2}$ (orange); B) compounds $\mathbf{1 5}$ (green) and $\mathbf{2}$ (orange) as reference; $\mathbf{C}$ ) compounds 27 (green), $\mathbf{2 9}$ (yellow) and $\mathbf{1}$ (purple) as reference; D) compounds $\mathbf{3 0}$ (green), $\mathbf{3 1}$ (yellow), $\mathbf{3 2}$ (cyan) and $\mathbf{1}$ (purple) as reference; $\mathbf{E}$ ) compounds $\mathbf{3 3}$ (green) and $\mathbf{1}$ (purple) as reference, at $\mathrm{hP} 2 \mathrm{Y}_{14} \mathrm{R}$. The receptor is represented in light gray. Panel $\mathbf{F}$ ) shows the superposition of compound $\mathbf{3 5}$ to compound 1, using as constraints the carboxylic carbon atom, the trifluoromethyl carbon atom, and the attachment point of the piperidine-phenyl group.

## Figure S8.

Ligand-Receptor Contacts

Figure S8. Number of contacts (distance within $4 \AA$ ) between the compound $\mathbf{1 7}$ and the hP2Y 14 R's residues during the simulations. Residues with no contacts with the ligand in none of the simulations are not reported. The results for replicates $1,2,3,4$ and 5 are showed in blue, green, yellow, orange and red, respectively. The simulations ( 50 ns ) were saved with a stride of 20 ps , resulting in 2500 frames (maximum number of contacts during a replicate). A bar at the bottom of the histograms shows the topological region of each residue.

Figure S9.

Figure S9. Analysis of the MD simulation (replicate 3) of the complex between compound $\mathbf{1 7}$ and hP2Y ${ }_{14}$ R. The replicate was chosen considering the lowest average ligand RMSD. A) RMSD of ligand heavy atoms relative to the docking pose, after alignment of the protein $\mathrm{C} \alpha$ atoms to the initial structure. B) Electrostatic and van der Waals (and Total, as sum of the two) ligand-receptor interaction energy. C) Hydrogen bonds between the ligand and residues that are in contact (within $4 \AA$ ) with it for at least half of the simulation. D) Electrostatic interaction between the ligand and residues that are in contact (within $4 \AA$ ) with it for at least half of the simulation. A colorimetric scale going from blue to red indicates negative to positive energy values.

Figure S10.

Figure S10. Analysis of the MD simulation (replicate 4) of the complex between compound $\mathbf{1 7}$ and $\mathrm{hP} 2 \mathrm{Y}_{14} \mathrm{R}$. The replicate was chosen considering the lowest average ligand RMSD. A) RMSD of ligand heavy atoms relative to the docking pose, after alignment of the protein $\mathrm{C} \alpha$ atoms to the initial structure. B) Electrostatic and van der Waals (and Total, as sum of the two) ligand-receptor interaction energy. C) Hydrogen bonds between the ligand and residues that are in contact (within $4 \AA$ ) with it for at least half of the simulation. D) Electrostatic interaction between the ligand and residues that are in contact (within $4 \AA$ ) with it for at least half of the simulation. A colorimetric scale going from blue to red indicates negative to positive energy values.

Video S1. MD trajectory (replicate 3) of the complex between compound $\mathbf{1 7}$ and hP2Y ${ }_{14}$, after alignment of the receptor $\mathrm{C} \alpha$ atoms to the initial frame. The receptor is depicted by a grey ribbon and the ligand by green sticks. The tips of TM6 and TM7 are transparent to enable the visualization of the ligand. Residues in contact with the ligand (within $4 \AA$ ) for at least half of the simulation are highlighted by sticks. Hydrogen bonds are shown by dashed lines. Water molecules around 2.5 $\AA$ from the ligand are rendered by red spheres.

Video S2. MD trajectory (replicate 4) of the complex between compound $\mathbf{1 7}$ and $\mathrm{hP} 2 \mathrm{Y}_{14} \mathrm{R}$, after alignment of the receptor $\mathrm{C} \alpha$ atoms to the initial frame. The receptor is depicted by a grey ribbon and the ligand by green sticks. The tips of TM6 and TM7 are transparent to enable the visualization of the ligand. Residues in contact with the ligand (within $4 \AA$ ) for at least half of the simulation are highlighted by sticks. Hydrogen bonds are shown by dashed lines. Water molecules around 2.5 $\AA$ from the ligand are rendered by red spheres.

## Procedures for measuring pION solubility and lipophilicity

Solubility using a modified pION method, ${ }^{1,2}$ and lipophilicity was measured based on the HPLC retention time. ${ }^{3}$
pION solubility tests. pION buffer and blank buffer preparation. pION solubility tests were performed with pION system solution (pION, Inc., Billerica, MA, USA, P/N 110151). pH 4.0 and 7.4 pION buffers were prepared by adding 2.5 mL of pION system solution to 97.5 mL of Milli Q water and adjusting the pH to 4.0 and 7.4 with 0.5 N NaOH , respectively. Blank buffers were prepared by mixing 15 mL of pION buffers ( pH 4.0 and 7.4 ) with 14 mL of $n$-propanol.

Control and sample UV plate preparation. All ligands were stored as 5 mM stock solutions in dimethyl sulfoxide (DMSO). $3 \mu \mathrm{~L}$ of each ligand stock solution (including DMSO control) was added to $300 \mu \mathrm{~L}$ of pH 4.0 and 7.4 pION buffers, mixed and incubated for 20 hours. The undissolved compound particles were removed by centrifuge at $14,000 \mathrm{rpm}$ for $20 \mathrm{~min} .100 \mu \mathrm{~L}$ of supernatant was added to a 96 well plate containing $100 \mu \mathrm{~L}$ of $n$-propanol and mixed well with pipette.

Reference UV plate preparation. $4 \mu \mathrm{~L}$ of each ligand stock solution was added to $76 \mu \mathrm{~L}$ of $n$ propanol. $10 \mu \mathrm{~L}$ of resulting solution was added to $290 \mu \mathrm{~L}$ of blank buffer, mixed and incubated for 20 hours. $200 \mu \mathrm{~L}$ of the reference solution with final concentration of ligand as $8.33 \mu \mathrm{M}$ was transferred to a 96 well plate.

UV absorption tests. The Greiner UV-Star ${ }^{\circledR} 96$ well plates have low UV absorption background and excellent resistance to general organic solvents. The UV absorption of control ( $\mathrm{A}_{\text {control }}$ ), ligands (Aligand), and references (Areference) were collected in triplicate at the ligands' maximum absorption at 270 nm .

Solubility calculation. Solubility (ligand) $=2 \mathrm{x}$ average $\left(\mathrm{A}_{\text {sample }}-\mathrm{A}_{\text {control }}\right) /$ average $\left(\mathrm{A}_{\text {reference }}-\mathrm{A}_{\text {control }}\right) \mathrm{x}$ $8.33 \mu \mathrm{M}=2 \mathrm{x}$ average ( $\mathrm{A}_{\text {sample- }} \mathrm{A}_{\text {control }}$ )/average ( $\mathrm{A}_{\text {reference }}-\mathrm{A}_{\text {control }}$ ) $\times 8.33 \times \mathrm{M}_{\mathrm{w}} \times 10^{-3} \mu \mathrm{~g} / \mathrm{mL}$.

Relative lipophilicities of PPTN analogues compared to compound 1. All ligands were stored as $250 \mu \mathrm{M}$ stock solutions in dimethyl sulfoxide (DMSO). HPLC based measurements of relative lipophilicities of analogues of $\mathbf{1}$ compared to $\mathbf{1}$ were carried out with an Agilent Eclipse XDB-C18 $(5 \mu \mathrm{~m})$ and a 20 min gradient of $10 \%$ to $100 \%$ acetonitrile in 10 mM triethylammonium acetate. The relative lipophilicity of $\mathbf{1}$ analogues compared to $\mathbf{1}$ was indicated by the retention factor difference between ligands and $\mathbf{1}\left(\Delta k=k_{\text {analogues }}-k_{1} ; k=\left(\mathrm{t}_{\mathrm{R}}-\mathrm{t}_{0}\right) / \mathrm{t}_{0}\right)$.
