## General Details

All reagents and solvents were used as purchased and no special precautions were taken to dry or otherwise further purify. For the purposes of thin layer chromatography (tlc), Merck silica-aluminium plates were used, visualising with UV light ( 254 nm ) and/or dipping in potassium permanganate followed by heating. For column chromatography, Sigma Aldrich technical grade $60 \AA$ silica gel was used. All NMR data was collected using either a Jeol Eclipse 400 MHz , Varian 400 MHz or Varian 500 MHz instruments. Data was processed directly using MestReNova (version 11.0.2). Chemical shifts ( $\delta$ ) are given in parts per million (ppm). Reference values for residual solvents were taken as $\delta=7.27$ $\left(\mathrm{CDCl}_{3}\right), 2.50\left(\mathrm{DMSO}_{-}\right)$and $2.05\left(\right.$ acetone- $\left.\mathrm{d}_{6}\right)$ for ${ }^{1} \mathrm{H}$ NMR and $\delta=77.16 \mathrm{ppm}\left(\mathrm{CDCl}_{3}\right), 39.52$ (DMSO- $\mathrm{d}_{6}$ ) and 206.26 (acetone- $\mathrm{d}_{6}$ ) for ${ }^{13} \mathrm{C}$ NMR. Multiplicities for coupled signals were denoted as: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet, br. = broad, app. = apparent and dd= double doublet etc. Coupling constants (J) are given in Hz and are quoted to the nearest 0.1 Hz . Where appropriate, COSY, DEPT, HMQC and NOE NMR experiments were carried out to aid assignment. Mass spectrometry data was collected was carried out by the University of Bristol mass spectrometry service using Fisons Autospec or Bruker Daltonics MicrOTOF II instruments. Infrared data was collected using a Perkin-Elmer Spectrum One FTIR machine as thin films or solids compressed on a diamond plate. Melting points are uncorrected and were recorded on Stuart Scientific apparatus.

## General Batch Irradiation Procedure

For all photochemical reactions, solvents were "degassed" by evacuating a stirred vessel under vacuum and re-filling with $\mathrm{N}_{2}$. For the duration of the reaction, $\mathrm{N}_{2}$ was bubbled through the solution. When photochemical reactions were followed for their duration by NMR, 1,3,5-trimethoxybenzene was used as an internal standard. In all cases, a stock solution $(0.05 \mathrm{M})$ of this was added to aliquots of the reaction mixture prior to NMR sample preparation. Batch reactors, 125 W and 400 W medium pressure mercury lamps were purchased from Photochemical Reactors Ltd. Reading. In all cases, Pyrex immersion wells were used for irradiations.

## Synthesis of Thioxanthone Derivatives

## Newman-Kwart Rearrangements

Substituted thiosalicylic acids were prepared from the corresponding methyl thiosalicylic acids via a Newman-Kwart rearrangement as shown (Scheme S1). The thermal Newman-Kwart rearrangement was successfully carried out as a melt for 4 -substituted derivatives but the 5 -substituted derivatives resulted in extensive degradation.

Scheme S1: Synthesis of thiosalicylic acids
A modification of the photoredox mediated Newman-Kwart rearrangement developed by Nicewicz ${ }^{1}$ gave the 5 -methoxysalicylate derivative in excellent yield (Scheme S2). Unfortunately, the 5 -fluoro derivative failed to react under the photoredox conditions.

## Synthesis of $\boldsymbol{O}$-aryl thiocarbamates

To a solution of the relevant methyl salicylate derivative ( 200 mmol ) and dimethylthiocarbamoyl chloride ( $37.1 \mathrm{~g}, 300 \mathrm{mmol}$ ) in DMF ( 100 ml ) was added DABCO ( $33.7 \mathrm{~g}, 300 \mathrm{mmol}$ ) before heating at $55^{\circ} \mathrm{C}$ for 3 hrs . The mixture was poured over water ( 500 ml ) and extracted with EtOAc ( $3 \times 300 \mathrm{ml}$ ). The combined extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to a yellow solid which was washed with $\mathrm{Et}_{2} \mathrm{O}$ and dried to give the thiocarbamate as a colourless powder.

## 4-methoxythiosalicylic acid

4-methoxythiosalicylic acid
The general procedure for $O$-aryl thiocarbamate synthesis was first followed using methyl 4methoxysalicylate ( $45 \mathrm{~g}, 247 \mathrm{mmol}$ ), dimethylthiocarbamoyl chloride ( $42.7 \mathrm{~g}, 346 \mathrm{mmol}$ ) and DABCO ( $38.8 \mathrm{~g}, 346 \mathrm{mmol}$ ). After heating at $55^{\circ} \mathrm{C}$ for 3 hrs the work-up procedure was followed to give methyl 2-((dimethylcarbamothioyl)oxy)-4-methoxybenzoate as a colourless powder ( $55.2 \mathrm{~g}, 83 \%$ ): m.p. 128 $129^{\circ} \mathrm{C}$ (lit. $\left.122-124^{\circ} \mathrm{C}\right)^{2}$

The $O$-aryl thiocarbamate ( $57.8 \mathrm{~g}, 215 \mathrm{mmol}$ ) was then heated as a melt at $200^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ for 5.5 hrs . The cooled mixture was purified by chromatography on silica ( $40-50 \%$ EtOAc in petrol) and the concentrated fractions were triturated with $\mathrm{Et}_{2} \mathrm{O}$ and filtered to give methyl 2-((dimethylcarbamoyl)thio)-4-methoxybenzoate as a pale orange solid ( $40.4 \mathrm{~g}, 70 \%$ ). To a solution of the $S$-aryl thiocarbamate ( $40.0 \mathrm{~g}, 149 \mathrm{mmol}$ ) in MeOH ( 110 ml ) was added LiOH ( $8.91 \mathrm{~g}, 372 \mathrm{mmol}$ ) and the mixture heated at reflux for 2.5 hrs . The cooled solution was quenched with $3 \mathrm{M} \mathrm{HCl}(130 \mathrm{ml})$, diluted with water $(100 \mathrm{ml})$ and the resulting slurry extracted with $\operatorname{EtOAc}(500 \mathrm{ml}$ and $2 \times 250 \mathrm{ml})$. The combined extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to give 4-methoxythiosalicylic acid as a white solid ( 28.0 g ) of sufficient purity for further use: $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}\right.$, DMSO-d $\left.\mathrm{d}_{6}\right) 7.88(1 \mathrm{H}, \mathrm{d}, J=8.8$ $\mathrm{Hz}, \mathrm{Ar} . \mathbf{H}), 7.11(1 \mathrm{H}, \mathrm{d}, J=2.6 \mathrm{~Hz}, \mathrm{Ar} . \mathrm{H}), 6.75(1 \mathrm{H}, \mathrm{dd}, J=8.8,2.6 \mathrm{~Hz}, \mathrm{Ar} . \mathrm{H}), 3.79\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right) ; \delta_{\mathrm{C}}$ ( 101 MHz , DMSO-d $\mathrm{d}_{6}$ ) 167.3 (C), 161.7 (C), 140.8 (C), 133.3 (CH), 118.8 (C), 115.0 (CH), 110.9 (CH), $55.5\left(\mathrm{CH}_{3}\right)$

## 4-fluorothiosalicylic acid

The general procedure for $O$-aryl thiocarbamate synthesis was first followed using methyl 4fluorosalicylate ( $29.8 \mathrm{ml}, 200 \mathrm{mmol}$ ), dimethylthiocarbamoyl chloride ( $37.1 \mathrm{~g}, 300 \mathrm{mmol}$ ) and DABCO ( $33.7 \mathrm{~g}, 300 \mathrm{mmol}$ ). After heating at $55^{\circ} \mathrm{C}$ for 3 hrs the work-up procedure was followed to give methyl 2-((dimethylcarbamothioyl)oxy)-4-fluorobenzoate as a colourless powder ( $42.3 \mathrm{~g}, 78 \%$ ): m.p. 106$107^{\circ} \mathrm{C}$ (lit. $\left.106.8-107.2^{\circ} \mathrm{C}\right)^{3}$

The $O$-aryl thiocarbamate $(41.0 \mathrm{~g}, 159 \mathrm{mmol})$ was heated as a melt at $200^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ for 2.5 hrs to give methyl 2-((dimethylcarbamoyl)thio)-4-fluorobenzoate. The resulting material was of sufficient
purity for subsequent hydrolysis. To a solution of the $S$-aryl thiocarbamate ( $41.0 \mathrm{~g}, 159 \mathrm{mmol}$ ) in MeOH $(110 \mathrm{ml})$ was added $\mathrm{LiOH}(9.53 \mathrm{~g}, 398 \mathrm{mmol})$ and the mixture heated at reflux for 2.5 hrs . The cooled solution was quenched with $3 \mathrm{M} \mathrm{HCl}(140 \mathrm{ml})$, diluted with water $(100 \mathrm{ml})$ and the resulting slurry extracted with EtOAc $(3 \times 250 \mathrm{ml})$. The combined extracts were washed ( 1 M HCl , brine), dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to give 4-fluorothiosalicylic acid as a white solid ( 27.6 g ) of sufficient purity for further use: $\delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}\right) 8.11(1 \mathrm{H}, \mathrm{dd}, J=8.7,6.0 \mathrm{~Hz}, \mathrm{Ar} . \mathrm{H}), 7.33(1 \mathrm{H}, \mathrm{dd}, J=$ $10.2,2.5 \mathrm{~Hz}, \mathrm{Ar} . \mathrm{H}), 7.20(1 \mathrm{H}$, app. td, $J=8.2,2.5 \mathrm{~Hz}, \mathrm{Ar} . \mathrm{H}) ; \delta_{\mathrm{C}}\left(126 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}\right) 166.8$ (C), $164.8(\mathrm{~d}, J=253.1 \mathrm{~Hz}, \mathrm{C}), 142.4(\mathrm{~d}, J=7.7 \mathrm{~Hz}, \mathrm{C}), 134.7(\mathrm{~d}, J=9.8 \mathrm{~Hz}, \mathrm{CH}), 124.8(\mathrm{~d}, J=2.8 \mathrm{~Hz}, \mathrm{C})$, $113.5(\mathrm{~d}, J=21.9 \mathrm{~Hz}, \mathrm{CH}), 111.7(\mathrm{~d}, J=26.8 \mathrm{~Hz}, \mathrm{CH}) ; \delta_{\mathrm{F}}\left(377 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)-105.1$

## 5-methoxythiosalicylic acid

5-methoxythiosalicylic acid
The general procedure for $O$-aryl thiocarbamate synthesis was first followed using methyl 5methoxysalicylate $(29.8 \mathrm{ml}, 200 \mathrm{mmol})$, dimethylthiocarbamoyl chloride ( $37.1 \mathrm{~g}, 300 \mathrm{mmol}$ ) and $\mathrm{DABCO}(33.7 \mathrm{~g}, 300 \mathrm{mmol})$. After heating at $55^{\circ} \mathrm{C}$ for 3 hrs the work-up procedure was followed to give methyl 2-((dimethylcarbamothioyl)oxy)-5-methoxybenzoate as a colourless powder ( $42.3 \mathrm{~g}, 78 \%$ ): m.p. $103-104^{\circ} \mathrm{C}\left(\text { lit. } 99.5-100.5^{\circ} \mathrm{C}\right)^{4}$

A solution of the $O$-aryl thiocarbamate $(4.31 \mathrm{~g}, 16 \mathrm{mmol})$ and 2, 4, 6-tris(4-methoxyphenyl)pyrylium tetrafluoroborate ( $0.08 \mathrm{mmol}, 39 \mathrm{mg}$ ) in $\mathrm{MeCN}(80 \mathrm{ml})$ was irradiated with a 36 W blue COB LED for 7 hrs . The solvent was removed in vacuo and chromatography on silica ( $10 \% \mathrm{Et}_{2} \mathrm{O}$ in DCM ) yielded methyl 2-((dimethylcarbamoyl)thio)-5-methoxybenzoate as a pale yellow solid ( $3.78 \mathrm{~g}, 88 \%$ ). To a solution of the $S$-aryl thiocarbamate $(23.0 \mathrm{~g}, 85.5 \mathrm{mmol})$ in $\mathrm{MeOH}(60 \mathrm{ml})$ was added $\mathrm{LiOH}(5.13 \mathrm{~g}$, 214 mmol ) and the mixture heated at reflux for 2.5 hrs . The cooled solution was quenched with 3 M $\mathrm{HCl}(80 \mathrm{ml})$ and the resulting slurry extracted with EtOAc ( 250 ml and $3 \times 100 \mathrm{ml}$ ). The combined extracts were washed ( 1 M HCl , brine), dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to give 5 methoxythiosalicylic acid $(15.7 \mathrm{~g})$ as a pale yellow solid of sufficient purity for further use: $\delta_{\mathrm{H}}(400$ $\left.\mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}\right) 7.42(1 \mathrm{H}, \mathrm{d}, J=3.0 \mathrm{~Hz}, \mathrm{Ar} . \mathrm{H}), 7.41(1 \mathrm{H}, \mathrm{d}, J=8.7 \mathrm{~Hz}, \mathrm{Ar} . \mathbf{H}), 7.04$ (dd, $J=8.7,3.0$ $\mathrm{Hz}, \mathrm{Ar} . \mathrm{H}), 3.75\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$; $\delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{DMSO}_{6}\right) 167.4$ (C), 156.4 (C), $131.9(\mathrm{CH}), 128.4$ (C), $127.5(\mathrm{C}), 119.6(\mathrm{CH}), 115.4(\mathrm{CH}), 55.3\left(\mathrm{CH}_{3}\right)$

## 5-fluorothiosalicylic acid

5-fluorothiosalicylic acid
The general procedure for $O$-aryl thiocarbamate synthesis was first followed using methyl 5fluorosalicylate ( $40 \mathrm{~g}, 235 \mathrm{mmol}$ ), dimethylthiocarbamoyl chloride ( $34.9 \mathrm{~g}, 282 \mathrm{mmol}$ ) and DABCO ( $31.6 \mathrm{~g}, 282 \mathrm{mmol}$ ). After heating at $55^{\circ} \mathrm{C}$ for 3 hrs the work-up procedure was followed to give methyl 2-((dimethylcarbamothioyl)oxy)-5-fluorobenzoate as a colourless powder ( $45.3 \mathrm{~g}, 75 \%$ ): m.p. 120$121^{\circ} \mathrm{C}$

The $O$-aryl thiocarbamate ( $43.1 \mathrm{~g}, 168 \mathrm{mmol}$ ) was then heated as a melt at $215^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ for 5.5 hrs . The cooled mixture was purified by chromatography on silica ( $30 \% \mathrm{EtOAc}$ in petrol) to give a dark oil $(25.8 \mathrm{~g})$ which contained the $S$-aryl thiocarbamate in approximately $60 \%$ purity due to a significant unknown by-product. To the crude mixture in $\mathrm{MeOH}(100 \mathrm{ml})$ was added $\mathrm{LiOH}(6.36 \mathrm{~g}, 265 \mathrm{mmol})$ and the solution heated at reflux for 3 hrs . The cooled solution was quenched with $3 \mathrm{M} \mathrm{HCl}(100 \mathrm{ml})$, extracted with $\mathrm{DCM}(3 \times 150 \mathrm{ml})$, the organic extracts concentrated in vacuo and re-dissolved in water $(150 \mathrm{ml})$ with $\mathrm{K}_{2} \mathrm{CO}_{3}(25 \mathrm{~g}, 181 \mathrm{mmol})$. The aqueous solution was washed with $\mathrm{DCM}(2 \times 50 \mathrm{ml})$ and
acidified with $\mathrm{HCl}(12 \mathrm{M}, 30 \mathrm{ml})$ to give a pale yellow suspension which was extracted with DCM $(3 \times 50 \mathrm{ml})$. The combined extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to give 5fluorothiosalicylic acid $(9.3 \mathrm{~g})$ containing significant impurities, but of sufficient purity for further use

## 4-methoxythioxanthone (4-MeOTX)

4-methoxythioxanthone
(4-MeOTX)
Thiosalicylic acid ( $30.8 \mathrm{~g}, 200 \mathrm{mmol}$ ) and $\mathrm{K}_{2} \mathrm{CO}_{3}(30.4 \mathrm{~g}, 220 \mathrm{mmol})$ were added to DMF ( 300 ml ) in a 1 L flask. $\mathrm{CuI}(3.8 \mathrm{~g}, 20 \mathrm{mmol})$ and 2-iodoanisole ( 28.6 ml , 220 mmol ) were then added and the mixture heated at $145^{\circ} \mathrm{C}$ for 19 hrs before cooling and pouring over water ( 500 ml ). The aqueous mixture was filtered before acidifying with $3 \mathrm{M} \mathrm{HCl}(80 \mathrm{ml})$. The resulting slurry was filtered and the residue washed with water, stirred in EtOH , filtered again and dried to give 2-((2methoxyphenyl)thio)benzoic acid as a grey power ( $48.3 \mathrm{~g}, 93 \%$ ).

A mixture of the thioether ( $52 \mathrm{~g}, 200 \mathrm{mmol}$ ) and polyphosphoric acid ( 100 g ) was heated at $130^{\circ} \mathrm{C}$ for 1 hr before allowing to cool and quenching with water $(150 \mathrm{ml})$. The mixture was mechanically broken up to a suspension which was extracted with $\operatorname{DCM}(500 \mathrm{ml})$. The aqueous solution was further extracted
with DCM $(2 \times 250 \mathrm{ml})$ and the combined extracts washed with sat. aq. $\mathrm{NaHCO}_{3}(2 \times 100 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to a beige solid ( 41.5 g ) which was recrystallized from MeCN ( 600 ml ) to give 4-methoxythioxanthone as a fluffy solid ( $39.3 \mathrm{~g}, 81 \%$ ): m.p. $168-169{ }^{\circ} \mathrm{C}\left(\text { lit. } 165{ }^{\circ} \mathrm{C}\right)^{5}$; $\lambda_{\max }(\mathrm{MeCN}) / \mathrm{nm} 385\left(\varepsilon / \mathrm{M}^{-1} \mathrm{~cm}^{-1} 5,940\right) ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.60(1 \mathrm{H}$, app. d, $J=8.1 \mathrm{~Hz}), 8.25(1 \mathrm{H}$, app. d, $J=8.4 \mathrm{~Hz}), 7.66-7.58(2 \mathrm{H}, \mathrm{m}), 7.50-7.41(2 \mathrm{H}, \mathrm{m}), 7.13(1 \mathrm{H}$, app. d, $J=7.9 \mathrm{~Hz}), 4.03(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{OCH}_{3}\right) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 180.2$ (C), 154.5 (C), 137.5 (C), $132.3(\mathrm{CH}), 130.4(\mathrm{C}), 129.8(\mathrm{CH})$, $129.1(\mathrm{C}), 127.7(\mathrm{C}), 126.8(\mathrm{CH}), 126.4(\mathrm{CH}), 126.1(\mathrm{CH}), 121.8(\mathrm{CH}), 112.33(\mathrm{CH}) 56.6\left(\mathrm{CH}_{3}\right)$; ESIHRMS m/z $243.0474\left(\mathrm{MH}^{+} \mathrm{C}_{14} \mathrm{H}_{11} \mathrm{O}_{2} \mathrm{~S}\right.$ requires 243.0474)

## 3-methoxythioxanthone (3-MeOTX)

(3-MeOTX)
Thiosalicylic acid ( $30.8 \mathrm{~g}, 200 \mathrm{mmol}$ ) and $\mathrm{K}_{2} \mathrm{CO}_{3}(30.4 \mathrm{~g}, 220 \mathrm{mmol})$ were added to DMF ( 400 ml ) in a 1 L flask. $\mathrm{CuI}(3.8 \mathrm{~g}, 20 \mathrm{mmol})$ and 3-bromoanisole ( $27.9 \mathrm{ml}, 220 \mathrm{mmol}$ ) were then added and the mixture heated at $145^{\circ} \mathrm{C}$ for 20 hrs before cooling and pouring over water ( 600 ml ). The aqueous mixture was filtered before acidifying with $3 \mathrm{M} \mathrm{HCl}(90 \mathrm{ml})$. The resulting slurry was filtered and the residue washed with water, stirred in EtOH , filtered again and dried to give 2-((3methoxyphenyl)thio)benzoic acid as a grey power ( $44.2 \mathrm{~g}, 85 \%$ ).

A mixture of the thioether ( $10 \mathrm{~g}, 38.4 \mathrm{mmol}$ ) in anhydrous DCM ( 70 ml ) with a few drops of DMF was cooled in an ice bath before the addition of $(\mathrm{COCl})_{2}(3.9 \mathrm{ml}, 46 \mathrm{mmol})$. The stirred mixture was removed from the ice bath until the reaction had reached completion before removing the solvent in vacuo. The residue was re-dissolved in anhydrous $\mathrm{DCM}(100 \mathrm{ml})$ and the solution cooled in an ice bath before the addition of $\mathrm{AlCl}_{3}(6.13 \mathrm{~g}, 46 \mathrm{mmol})$. A mixture of the thioether $(13.9 \mathrm{~g}, 48 \mathrm{mmol})$ and polyphosphoric acid $(130 \mathrm{~g})$ was heated at $120^{\circ} \mathrm{C}$ for 1 hr before allowing to cool and quenching with water $(100 \mathrm{ml})$. The mixture was mechanically broken up to a suspension which was extracted with DCM , washed with sat. aq. $\mathrm{NaHCO}_{3}$, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to a yellow solid ( 11.8 g ) which was recrystallized from $\mathrm{MeCN}(155 \mathrm{ml})$ to give 2,7-dimethoxythioxanthone as a fluffy yellow solid ( $10.5 \mathrm{~g}, 80 \%$ ): m.p. $155-157{ }^{\circ} \mathrm{C} ; \lambda_{\max }(\mathrm{MeCN}) / \mathrm{nm}$

## Triplet Measurements of Thioxanthone Derivatives

## Low temperature ( 77 K ) emission measurement:

The low temperature emission spectra were measured in FLS900 Fluorescence spectrometer (Edinburgh Instrument). The room temperature absorption spectra were measured in UV-Vis spectrometer (Agilent Cary 60). For all the measurements $10 \mu \mathrm{M}$ concentration was used. Methylcyclohexane (Alfa Aesar), 2-methyl tetrahydrofuran (Alfa Aesar) were used as received.

Figure S3: Room temperature absorption and glass temperature emission spectra of thioxathone in methylcyclohexane. The excitation wavelength was 380 nm .

In Figure S3, the room temperature absorption and glass temperature emission spectra are presented for the thioxanthone. It is well known that the thioxanthone is nonemissive in nonpolar solvents at room temperature. Therefore, the strong red-shifted emission observed in nonpolar solvent (Methylcyclohexane) at glass temperature is safely assigned to the emission from the triplet state. The highest energy emission band ( 436 nm ) is used as the lowest triplet energy and it matches well with the reported triplet energy of thioxanthone. The emission and absorption spectra of other molecules are presented in Figure S4

Figure S4. Room temperature absorption and glass temperature emission spectra of different thioxathone derivatives in methylcyclohexane. The lowest energy bands are mentioned and the calculated triplet energies are reported. The excitation wavelengths are: 350 nm ( $3,3^{\prime}-$ MeOTX), 360 nm (3,3'-FTX), 370 nm (3-MeOTX), 375 nm (3-FTX), 380 nm (ITX), 385 nm (2-FTX), 390 nm (4-MeOTX) respectively.

The emission results at 77 K in 2-MeTHF for the last three derivatives, 2-MeOTX, 2-F, $2^{\prime}-\mathrm{MeOTX}, ~ 2,2^{\prime}$ 'MeOTX are shown in Figure S5

## (2-MeOTX in 2-methyl tetrahydrofuran

Figure S5. Room temperature absorption, room temperature emission and 77 K emission of the thioxanthone derivatives in 2methyl tetrahydrofuran. For all the measurements 390 nm excitation wavelength was used. Here we have plotted all the spectra with x -axis normalized.

## ps and ns TRIR Studies

## Instrumentation

We performed ps and ns time-resolved infrared (TRIR) measurements in order to measure the singlet and triplet lifetimes. All the measurements were performed in $\mathrm{CD}_{3} \mathrm{CN}(1 \mathrm{mM})$. Each solution was degassed using three freeze pump thaw cycles before time-resolved measurements. The sample Harrick cell (path length $400 \mu \mathrm{~m}$ ) with $\mathrm{CaF}_{2}$ windows was continuously raster scan in order to avoid photodamage. The detailed description of the TRIR measurements at the Nottingham has been discussed in detail elsewhere. ${ }^{8}$ Breifly, $800 \mathrm{~nm}, 100 \mathrm{fs}, 80 \mathrm{MHz}$ fundamental pulses are generated with a commercial Ti:Sapphire oscillator (MaiTai). The input pulses are amplified in a Ti:Sapphire amplifier (Spitfire Pro/Spectra Physics) to produce $800 \mathrm{~nm}, 100 \mathrm{fs}, 1 \mathrm{kHz}, 2 \mathrm{~mJ}$ pulses. Half of the output is used to pump a TOPAS-C (Light Conversion) that produces tunable IR pulses using a difference frequency generator. The other part of the amplifier output is used to pump a harmonic generator (Timeplate tripler, Minioptic Technology) to produce $400 \mathrm{~nm}, 100 \mathrm{fs}$ pump pulses. For 355 nm picosecond experiments, we have used a second TOPAS output pumped by the 800 nm fundamental. The IR beam passes through a Ge beam splitter and half of the IR beam is reflected onto a single element MCT detector (Kolmar Technology) to serve as a reference and the other half is focused and overlaps with the pump beam at the sample position. The pump pulse was delayed relative to the probe pulse by using a translation stage (LMA Actuator, Aerotech, USA. The polarization of the pump pulse was set at the magic angle ( $54.7^{\circ}$ ) relative to the probe pulse to avoid rotational diffusion. For a measurement with a longer time delays a Q-switched Nd:YVO ns-laser (ACE- 25QSPXHP/MOPA, Advanced Optical Technology, UK) was employed as a pump source and this was synchronized relative to the Spitfire Pro amplifier output. The IR probe beam was dispersed with a spectrograph and detected with a 128 element HgCdTe linear array detector (Infrared Associates, USA).

## ps ( 400 nm excitation) TRIR spectra and kinetics of ITX

The ps and ns TRIR spectra of ITX in $\mathrm{CD}_{3} \mathrm{CN}$ as the photophysical properties (singlet lifetime, triplet quantum yield) are well known. The ps TRIR spectra of ITX in the $1650-1450 \mathrm{~cm}^{-1}$ region for selected time delays after 400 nm excitation were presented in Figure S6. The negative peaks at 1637 and 1592 $\mathrm{cm}^{-1}$ are associated with the ground state bleach and are assigned to $v(\mathrm{C}=\mathrm{O})$ and $v(\mathrm{C}=\mathrm{C})$ bands respectively. The transient peak at $1477 \mathrm{~cm}^{-1}$ appears immediately after the flash and is assigned to the singlet excited state. The $1477 \mathrm{~cm}^{-1}$ band decays at the same rate ( $240 \pm 10 \mathrm{ps}$ ) as a new band at 1518 $\mathrm{cm}^{-1}$ grows in and this peak is assigned to the triplet state.

Figure S6. (a) ps-TRIR spectra of ITX for selected time delays in $\mathrm{CD}_{3} \mathrm{CN}$ following photoexcitation ( 400 nm ). (b) and (c) show selected TRIR kinetic traces associated with the formation and decay of the parent $\left(1592 \mathrm{~cm}^{-1}\right)$, singlet ( $1477 \mathrm{~cm}^{-1}$ ) and triplet ( 1518 $\mathrm{cm}^{-1}$ ) excited state bands obtained from TRIR spectra.

## Estimation of triplet quantum yield for ITX from the parent bleach recovery kinetics

The triplet quantum yield ( $\Phi_{\text {ISC }}$ ) is estimated from the parent bleach recovery kinetics using the approximation that triplet quantum yield is given by the $\Delta \mathrm{A}^{\max } / \Delta \mathrm{A}^{\infty}$ ratio.

Figure S7. ps intensity kinetics of $1592 \mathrm{~cm}^{-1}$ band. The initial bleach recovery is associated with ground state recovery due to radiative (fluorescence) and nonradiative (internal conversion) decays. The bleach recovery at longer time is used to calculate the triplet quantum yield.

## Synthesis of Novel Photochemical Precursors

Amino cinnamate 8

Scheme S3
A stirred suspension of $\mathrm{NaH}(60 \%$ on oil, $32 \mathrm{~g}, 800 \mathrm{mmol})$ in toluene $(300 \mathrm{ml})$ with dimethyl carbonate $(68 \mathrm{ml}, 808 \mathrm{mmol})$ was heated to $95^{\circ} \mathrm{C}$ in a 1 L flask with an overhead stirrer and condenser. A solution of acetophenone $(46.6 \mathrm{ml}, 400 \mathrm{mmol})$ in toluene $(100 \mathrm{ml})$ was added dropwise to allow for a controlled exotherm and $\mathrm{H}_{2}$ evolution. After the addition was complete, heating was continued for 1 hour before the solution was cooled in an ice bath and quenched with acetic acid ( $23 \mathrm{ml}, 400 \mathrm{mmol}$ ) and 1 M HCl $(400 \mathrm{ml})$. The biphasic mixture was separated and the aqueous layer further extracted with EtOAC $(2 \times 150 \mathrm{ml})$ before the pooled organic extracts were washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated in vacuo. The resulting oil was filtered through silica with pet. ether $40 / 60$, then $\mathrm{Et}_{2} \mathrm{O}$ and the solution evaporated under reduced pressure to give the 1,3-keto ester as an oil ( $71.5 \mathrm{~g}, 100 \%$ ). 53.5 $\mathrm{g}(300 \mathrm{mmol})$ of this oil, along with allylamine $(45 \mathrm{ml}, 600 \mathrm{mmol})$ and acetic acid ( $34 \mathrm{ml}, 600 \mathrm{mmol}$ ) was added to $\mathrm{EtOH}(300 \mathrm{ml})$ in a 1 L flask and the solution refluxed for 3 hours until all keto-ester had been consumed. The cooled solution was concentrated, purified by chromatography on silica (10-20\% $\mathrm{Et}_{2} \mathrm{O}$ in petrol) and concentrated to an oil ( 52 g ) with was re-dissolved in petrol ( 50 ml ), cooled in a freezer at $-20^{\circ} \mathrm{C}$ and the resulting suspension rapidly filtered to give $\mathbf{8}$ as a white solid ( $47.5 \mathrm{~g}, 73 \%$ ): m.p. $35-36^{\circ} \mathrm{C} ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.61(1 \mathrm{H}, \mathrm{s}, \mathrm{NH}), 7.43-7.32(5 \mathrm{H}, \mathrm{m}, \mathrm{Ar} . \mathbf{H}), 5.78(1 \mathrm{H}, \mathrm{ddt}, J=$ $17.1,10.1,4.9 \mathrm{~Hz}, \mathrm{CH}=\mathrm{CHH}), 5.21(1 \mathrm{H}$, app. dq, $J=17.1,1.7 \mathrm{~Hz}, \mathrm{CH}=\mathrm{CHH}), 5.11(1 \mathrm{H}$, app. dq,$J=$ $10.3,1.6 \mathrm{~Hz}, \mathrm{CH}=\mathrm{CHH}), 4.64(1 \mathrm{H}, \mathrm{s}, \mathrm{CH}=\mathrm{C}), 3.72-3.64\left(5 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2}, \mathrm{OCH}_{3}\right) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $170.9(\mathrm{C}), 165.1(\mathrm{C}), 136.0(\mathrm{C}), 135.5(\mathrm{CH}), 129.5(\mathrm{CH}), 128.5(2 \times \mathrm{CH}), 127.9(2 \times \mathrm{CH}), 116.0\left(\mathrm{CH}_{2}\right)$, $85.5(\mathrm{CH}), 50.4\left(\mathrm{CH}_{2}\right), 46.9\left(\mathrm{CH}_{3}\right)$; ESI-HRMS m/z $218.1180\left(\mathrm{MH}^{+} \mathrm{C}_{13} \mathrm{H}_{16} \mathrm{NO}_{2}\right.$ requires 218.1176)

## Boc protection to 25

Scheme S4
To a solution of amino cinnamate $\mathbf{8}(21.7 \mathrm{~g}, 100 \mathrm{~mol})$ in $\mathrm{MeCN}(100 \mathrm{ml})$ was added $\mathrm{Boc}_{2} \mathrm{O}(28.3 \mathrm{~g}, 130$ mmol ) and DMAP ( $0.61 \mathrm{~g}, 5 \mathrm{mmol}$ ) and the mixture heated to $65^{\circ} \mathrm{C}$. After gas evolution had ceased, additional $\mathrm{Boc}_{2} \mathrm{O}(16.7 \mathrm{~g}, 77 \mathrm{mmol})$ was added portionwise. The solution was concentrated and purified by chromatography on silica ( $10-20 \% \mathrm{Et}_{2} \mathrm{O}$ in petrol) to give 25 as a solid ( $19.0 \mathrm{~g}, 60 \%$ ): m.p. $60-61$ ${ }^{\circ} \mathrm{C} ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.40-7.29(5 \mathrm{H}, \mathrm{m}, \mathrm{Ar} . \mathrm{H}), 5.92(1 \mathrm{H}, \mathrm{ddt}, J=17.0,10.6,5.4 \mathrm{~Hz}, \mathrm{CH}=\mathrm{CHH})$, $5.86(1 \mathrm{H}, \mathrm{s}, \mathrm{CH}=\mathrm{C}), 5.25-5.16(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}=\mathrm{CHH}), 4.24\left(2 \mathrm{H}, \mathrm{app} . \mathrm{dt}, J=5.4,1.6 \mathrm{~Hz}, \mathrm{NCH}_{2}\right), 3.56$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 1.15\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 167.0(\mathrm{C}), 156.1(\mathrm{C}), 153.7(\mathrm{C}), 136.9(\mathrm{C})$, $133.6(\mathrm{CH}), 129.4(\mathrm{CH}), 128.8(2 \times \mathrm{CH}), 127.8(2 \times \mathrm{CH}), 117.1\left(\mathrm{CH}_{2}\right), 109.7(\mathrm{CH}), 81.8(\mathrm{C}), 53.3\left(\mathrm{CH}_{2}\right)$, $51.3\left(\mathrm{CH}_{3}\right)$, $27.8\left(3 \times \mathrm{CH}_{3}\right)$; ESI-HRMS m/z $318.1699\left(\mathrm{MH}^{+} \mathrm{C}_{18} \mathrm{H}_{24} \mathrm{NO}_{4}\right.$ requires 318.1700)

## $\alpha$-amido acrylate 13

Scheme S5
Solvent-free Baylis-Hillman : A mixture of methyl acrylate ( $333 \mathrm{mmol}, 1.0 \mathrm{eq}$.), benzaldehyde ( 333 $\mathrm{mmol}, 1.0 \mathrm{eq}$.) and $\mathrm{DABCO}(20 \mathrm{~mol} \%)$ was stirred at room temp for 5 days before pouring over 1 M $\mathrm{HCl}(250 \mathrm{ml})$ and extracting with $\mathrm{EtOAc}(3 \times 200 \mathrm{ml})$. The organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to an oil $(62.9 \mathrm{~g})$ containing $\sim 15 \mathrm{~mol} . \%$ benzaldehyde. The product $\mathbf{A}$ was of sufficient purity to use in next step.

Acylation: To an ice cooled solution of the above Baylis-Hillman adduct $\mathbf{A}$ in $\mathrm{DCM}(\sim 300 \mathrm{mmol}$; 2 M ), and pyridine ( 1.15 eq ), was added acetyl chloride ( 1.15 eq. ) dropwise. The mixture was allowed to warm to room temperature and stirring continued until the alcohol was fully consumed (monitored by tlc). The concentration was halved by the addition of more DCM and the mixture washed with 1 M $\mathrm{HCl}(\times 2)$ and water. The solution was dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to give $\mathbf{B}$ as an oil containing residual benzaldehyde as an impurity ( $\sim 15 \%$ ). Yield $\approx 83 \%$ (2-steps)

Ser-OMe.HCl: Acetyl chloride ( 2.5 eq ) was added dropwise to $\mathrm{MeOH}(600 \mathrm{ml})$ before the portionwise addition of DL-serine ( $0.5 \mathrm{~mol}, 1.0$ eq.) and the mixture refluxed for 2 hrs . The solvent was evaporated, the product was triturated with $\mathrm{Et}_{2} \mathrm{O}$, filtered and washed $\left(\mathrm{Et}_{2} \mathrm{O}\right)$ before drying to a free-flowing powder (76 g, 98\%)

Serine Adduct C: To a 1:1 THF/Water solution of crude allylic acetate B ( $200 \mathrm{mmol}, 1 \mathrm{M}$ ) cooled in an ice bath was added DABCO ( 2.5 eq.) The ice bath was removed and the mixture stirred for 15 min before the portionwise addition of Ser-OMe. $\mathrm{HCl}(1.2 \mathrm{eq}$.$) . The mixture was stirred, until the reaction$ had gone to completion, before removal of THF under reduced pressure. The remaining mixture was extracted with EtOAc, dried $\left(\mathrm{MgSO}_{4}\right)$ and chromatography on silica (gradient elution $30 \%-80 \% \mathrm{EtOAc}$ in hexane) yielded the product $\mathbf{C}$ as an oil $(49 \mathrm{~g})$, free from benzaldehyde and as a mix of diastereomers.

Benzoylation to E: To a solution of $\mathbf{C}(\sim 167 \mathrm{mmol})$ in $\mathrm{DCM}(1 \mathrm{M})$ was added $\mathrm{Et}_{3} \mathrm{~N}(1.15 \mathrm{eq}$.) and the solution cooled in an ice bath after which was added $\mathrm{BzCl}(1.15 \mathrm{eq}$.) dropwise. The solution was stirred at room temperature for approx. 1 hr . before washing with $1 \mathrm{M} \mathrm{HCl}(\times 2)$ and brine. The solution was dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to $\mathbf{D}$ an oil which was used directly for the second benzoylation. To solution of $\mathbf{D}$ in $\mathrm{MeCN}(1 \mathrm{M})$ and $\mathrm{Et}_{3} \mathrm{~N}(1.2$ eq.) was added $\mathrm{BzCl}(1.2 \mathrm{eq})$ and the mixture then heated at reflux with stirring until full consumption of the starting material (tlc monitoring). After cooling to room temperature the slurry was filtered and the solution concentrated in vacuo before redissolving in DCM and washing with 1 M HCl and brine. The solution was dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated to an oil which was purified by chromatography on silica ( $20-30 \% \mathrm{EtOAc}$ in hexane) to give $\mathbf{E}$ as an oil ( 75 g , mixture of diastereomers).

Benzoate Elimination to 13: To an ice cooled solution of $\mathbf{E}(\sim 150 \mathrm{mmol})$ in $\mathrm{DCM}(0.6 \mathrm{M})$ was added neat $\operatorname{DBU}$ ( 1 eq.) dropwise. The ice bath was removed and stirring continued until the reaction had gone to completion (tlc monitoring). The solution was washed (sat. $\mathrm{NaHCO}_{3}$ ), brine and dried ( $\mathrm{MgSO}_{4}$ ). Chromatography on silica ( $30 \% \mathrm{EtOAc}$ in hexane) yielded product 13 as a white solid $(40.5 \mathrm{~g}, 50 \%$ from B): m.p. $110-112{ }^{\circ} \mathrm{C}$; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.55-7.50(2 \mathrm{H}, \mathrm{m}, \mathrm{Ar} . \mathrm{H}), 7.38-7.23(8 \mathrm{H}, \mathrm{m}$, Ar.H), $6.71(1 \mathrm{H}, \mathrm{br} . \mathrm{s}, \mathrm{PhCH}), 6.56(1 \mathrm{H}$, app. t, $J=1.0 \mathrm{~Hz}, \mathrm{CHH}=\mathrm{C}), 5.99-5.97(1 \mathrm{H}, \mathrm{m}, \mathrm{CHH}=\mathrm{C})$, $5.96(1 \mathrm{H}, \mathrm{d}, J=0.7 \mathrm{~Hz}, \mathrm{CHH}=\mathrm{C}), 5.45(1 \mathrm{H}, \mathrm{d}, J=0.7 \mathrm{~Hz}, \mathrm{CHH}=\mathrm{C}), 3.70\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 3.43(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 171.1(\mathrm{C}), 166.6(\mathrm{C}), 164.8(\mathrm{C}), 139.5(\mathrm{C}), 139.4(\mathrm{C}), 136.5(\mathrm{C}), 136.3$ $(\mathrm{C}), 130.5(\mathrm{CH}), 129.7(2 \times \mathrm{CH}), 128.4(2 \times \mathrm{CH}), 128.3(2 \times \mathrm{CH}), 128.2(2 \times \mathrm{CH}), 128.1(\mathrm{CH}), 127.8\left(\mathrm{CH}_{2}\right)$, $124.8\left(\mathrm{CH}_{2}\right), 62.5(\mathrm{CH}), 52.3\left(\mathrm{CH}_{3}\right), 52.2\left(\mathrm{CH}_{3}\right)$; ESI-HRMS m/z $380.1496\left(\mathrm{MH}^{+} \mathrm{C}_{22} \mathrm{H}_{22} \mathrm{NO}_{5}\right.$ requires 380.1498)

## Amido styrene 23

Scheme S6
A solution of $\alpha$-tetralone ( $100 \mathrm{~g}, 684 \mathrm{mmol}$ ) and allylamine ( $77 \mathrm{ml}, 1.03 \mathrm{~mol}$ ) in cyclohexane ( 250 ml ) was stirred over $3 \AA$ molecular sieves, $3-5 \mathrm{~mm}$ beads, $(140 \mathrm{~g})$ in a 1 L flask, heated at $50^{\circ} \mathrm{C}$ for 90 hrs ( $95 \%$ conversion). The mixture was filtered through celite, concentrated in vacuo and the resulting oil poured oved DCM $(500 \mathrm{ml})$, cooled in an ice bath, before the addition of benzoyl chloride ( $79 \mathrm{ml}, 684$ mmol ) then triethylamine ( $95 \mathrm{ml}, 684 \mathrm{mmol}$ ) over about 20 mins . The fully charged vessel was allowed to warm to room temperature and stirred for 17 hrs before filtering and the filtrate washed $(1 \mathrm{M} \mathrm{HCl}$, sat. aq. $\mathrm{NaHCO}_{3}$ and brine), dried $\left(\mathrm{MgSO}_{4}\right)$ and filtered before concentrating under reduced pressure. To the resulting oil was added hexane to allow trituration of the product before filtering to give enamide 23 as an off-white solid ( $139 \mathrm{~g}, 70 \%$ ): m.p. $86-87^{\circ} \mathrm{C}$; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.49-7.11(9 \mathrm{H}, \mathrm{m}$, Ar.H), $5.99\left(1 \mathrm{H}\right.$, dddd, $\left.J=17.3,10.2,7.3,5.4 \mathrm{~Hz}, \mathrm{CH}_{2}=\mathrm{CH}\right), 5.52\left(1 \mathrm{H}, \mathrm{dd}, J=6.0,3.5 \mathrm{~Hz}, \mathrm{C}=\mathrm{CHCH}_{2}\right)$, $5.22-5.09\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}=\mathrm{CH}\right), 4.83(1 \mathrm{H}, \mathrm{dd}, J=14.5,5.4 \mathrm{~Hz}, \mathrm{NCHHCH}), 3.68(1 \mathrm{H}, \mathrm{dd}, J=14.5,7.3$ $\mathrm{Hz}, \mathrm{NCHHCH}), 2.73\left(1 \mathrm{H}\right.$, app. td, $\left.J=14.3,6.7 \mathrm{~Hz}, \mathrm{CCHHCH}_{2}\right), 2.60(1 \mathrm{H}$, app. dt, $J=15.5,5.9 \mathrm{~Hz}$, $\left.\mathrm{CCHHCH}_{2}\right), 2.18\left(1 \mathrm{H}\right.$, app. dq, $\left.J=17.6,6.1 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CHHCH}\right), 2.00(1 \mathrm{H}$, dddd, $J=17.0,13.5,6.7,3.5$ $\left.\mathrm{Hz}, \mathrm{CH}_{2} \mathrm{CHHCH}\right) ; \delta_{\mathrm{C}}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 171.2(\mathrm{C}), 138.8(\mathrm{C}), 137.3(\mathrm{C}), 136.2(\mathrm{C}), 133.1(\mathrm{CH}), 131.8$ $(\mathrm{C}), 130.0(\mathrm{CH}), 129.4(\mathrm{CH}), 128.1(\mathrm{CH}), 128.1(\mathrm{CH}), 127.8(2 \times \mathrm{CH}), 127.6(2 \times \mathrm{CH}), 127.0(\mathrm{CH}), 122.8$ $(\mathrm{CH}), 118.4\left(\mathrm{CH}_{2}\right), 50.2\left(\mathrm{CH}_{2}\right), 27.3\left(\mathrm{CH}_{2}\right), 22.9\left(\mathrm{CH}_{2}\right)$; ESI-HRMS m/z $290.1549\left(\mathrm{MH}^{+} \mathrm{C}_{20} \mathrm{H}_{20} \mathrm{NO}\right.$ requires 290.1539)

## Novel Reactor Configurations

## Parallel NMR Tube Irradiations

For rapid screening of the sensitizer series, a simple new method was devised to save time and material. Irradiations were carried out directly in standard NMR tubes using deuterated acetonitrile. Stock solutions of the substrate ( $5 \mathrm{ml}, 0.1-0.2 \mathrm{M}$ ) were prepared in a 5 ml volumetric flask, with adiponitrile ( 0.5 eq ) as an internal standard if necessary, before dispensing 0.4 ml aliquots into individual NMR tubes containing the sensitizer of interest. The solutions were then irradiated in parallel with a 9 W PLS UVA lamp by holding the tubes equidistant from the lamp ( $1-2 \mathrm{~mm}$ ) using an improvised tube holder (Figure S10). The low power output of the lamp meant that external cooling was not required.

The reaction progress was monitored periodically by ${ }^{1} \mathrm{H}-\mathrm{NMR}$. By using this method, the entire sensitizer series could be screened within a working day, without the need for sample preparation, and using just $0.5-1.0 \mathrm{mmol}$ of the substrate.

## 36 W Blue COB Reactor Configuration

To investigate the efficacy of the visible light absorbing TX derivatives as 'energy transfer photocatalysts' it was necessary to construct a novel reactor based around a high-intensity blue light source. Reported reactors for visible light photocatalysis are usually based around SMD (Surface Mount Device) LED chips. Single colour, high power SMD LEDs typically operate at about $1-3 \mathrm{~W}$, have about 1-3 individual diodes in a single housing and must be connected in arrays if more power / light intensity is required.

COB (Chip On board) LEDs have many more diodes (>9) mounted on a single surface and can offer much higher power densities without having to connect multiple chips in an array. These devices can be commonly found in high power white LED spotlights. The white light is produced by a phosphor film over an LED chip which down-converts a higher energy light source to the full range of visible colours. . In the case of white COB LEDs the phosphor is driven by the much easier / cheaper to access emission from blue LEDs. As a result, all white COB chips have at their centre a powerful source of blue light which is ideal for many photoredox catalysts and lower energy triplet sensitizers which can excited by visible light. Interestingly, 'naked' blue COB chips have only relatively recently become commercially available. LED manufacturer Citizen produce such chips for aquariums, swimming pools and architectural use.

A tray of the $34.6 \mathrm{~V}, 22 \mathrm{~mm}$ COB chips was ordered for initial investigations based on the convenient chip size and availability of a compact 36 W 1.05 A constant current driver. The peak wavelength is 455 nm and the emission spans from approximately $430-480 \mathrm{~nm}$.

## 36 W Blue COB Reactor Construction

The key requirements of a photochemical batch reactor are:

1) light source in optimal position to ensure efficient light delivery to solution
2) a means of stirring solution and
3) effective heat management.

Reported visible light mediated photoredox reactions are often driven by a 40 W Kessil lamp or a flexible LED strip placed side-on and a few centimetres away from a vial containing the reaction solution (Figure S11, left). The overall light capture is poor and as a result the reactions are often left on overnight to drive a successful reaction to completion. The side-on method of irradiation is necessary since the vials are stirred over a magnetic stirrer and there is no room below for the bulky commercial light source.

Figure S11 - Left: Inefficient side-on irradiation with external Kessil lamps over magnetic stirrer; Right: Novel integrated COB LED and magnetic stirrer for efficient light capture

The use of a COB LED allows for efficient stirring with simultaneous irradiation since the flat COB chip can be mounted directly onto the metal surface of a magnetic stirrer without affecting its ability to stir (Figure S11, right). In this way, a vessel can be magnetically stirred directly over the high intensity
discharge of the COB. In the case of the 36 W COB used, it was assumed the metal body of the stirrer should allow for sufficient heat dissipation and so prevent the COB chip overheating.

The reactor was based around a Heidolph stirrer hotplate with broken heating controls (Figure S12). The heating circuitry could be removed and replaced with the LED driver which fortuitously fit neatly within the resulting cavity. As a result, the driver could be wired internally onto the original heating switch allowing for a compact and safe design with minimal effort. The LED COB was fixed to the plate with a commercially available mount and a couple of screws tapped into the metal surface. Thermal contact was made with some thermal paste.

Figure S12: Working prototype of the 36 W blue COB reactor
Stirring acetonitrile in a 50 ml rbf over the 36 W COB resulted in rapid heating of the solvent to near reflux and so a fan was introduced to the side of the vessel. This allowed the temperature to be maintained below $40^{\circ} \mathrm{C}$ and also assisted in cooling the surface of the stirrer. Additional control over the temperature could involve a small double jacketed vessel or cold-finger.

## Alkene Isomerization Studies in NMR Tubes

Scheme S8
A stock solution was prepared in a 5 ml volumetric flask using 1 mmol of the relevant trans-styrene derivative and deuterated acetonitrile ( 0.2 M ). For each irradiation, 0.5 ml aliquots were added to an NMR tube containing the relevant thioxanthone derivative ( $5 \mathrm{~mol} \%$ ) before gently warming to ensure the sensitizer was fully dissolved. The NMR tube was placed against a low pressure 9 W PL-S UVA lamp and the isomeric ratio was monitored every 15 mins by ${ }^{1} \mathrm{H}-\mathrm{NMR}$.

## Blue Light Mediated Reactions with 36 W, 455 nm COB Reactor

## General procedure

A solution of the relevant substrate in degassed solvent was added to a multi-necked round bottom flask connected to a nitrogen line. The headspace was purged with $\mathrm{N}_{2}$ several times before the addition of $2,2^{\prime}$-MeOTX. The solution was stirred over the modified hotplate COB reactor (see above) from a distance of approximately 15 mm , with fan cooling. Sample were taken periodically for quantitative analysis by ${ }^{1} \mathrm{H}$-NMR using $1,3,6$-trimethoxybenzene as an internal standard (see general batch irradiation procedure above) to determine the precise endpoint of the reaction for accurate reactor comparison.

## Crystallography

X-ray diffraction experiments on $\mathbf{2 4}$ and $\mathbf{2 6}$ were carried out at $100(2) \mathrm{K}$ on a Bruker APEX II diffractometer with CCD using Mo- $\mathrm{K}_{\alpha}$ radiation $(\lambda=0.71073 \AA)$. Intensities were integrated in SAINT ${ }^{12}$ and absorption corrections based on equivalent reflections were applied using SADABS. ${ }^{13}$ Both structures were solved using ShelXT ${ }^{14}$ and refined by full matrix least squares against $F^{2}$ in ShelXL ${ }^{15,16}$ using Olex $2^{17}$. All of the non-hydrogen atoms were refined anisotropically. While all of the hydrogen atoms were located geometrically and refined using a riding model. Crystal structure and refinement data are given in Table S37. Crystallographic data for compounds $\mathbf{2 4}$ and $\mathbf{2 6}$ have been deposited with the Cambridge Crystallographic Data Centre as supplementary publication CCDC 1989743-1989744. Copies of the data can be obtained free of charge on application to CCDC, 12 Union Road, Cambridge CB2 1EZ, UK [fax(+44) 1223 336033, e-mail: deposit@ccdc.cam.ac.uk].
