Scheme S1. The scheme of the inner irradiation reactor

The formation rates of the products $\left(\mathrm{CO}, \mathrm{H}_{2}\right.$ and $\left.\mathrm{O}_{2}\right)$ were calculated by the follow equation:
Formation rate of products $\left./ \mathbf{m o l} \mathbf{h}^{-1}=S^{*} \boldsymbol{c}^{* /(1 ~ m L}\right) *(30 \mathrm{~mL} / \mathrm{min}) * 60 \mathrm{~min}$
Where $\boldsymbol{S}$ represents the peak area of gas products detected by the TCD-GC, and FID-GC, $\boldsymbol{c}$ represents a factor of the relationship between the amount of the gas products and the peak area of gas products such as $\mathrm{CO}, \mathrm{H}_{2}$, and $\mathrm{O}_{2}$. The factor $\boldsymbol{c}$ was obtained by flowing the Ar-diluted mixture gas which contained certain concentration of $\mathrm{CO}, \mathrm{H}_{2}$, and $\mathrm{O}_{2}$ at different flow rate. The sample loop of TCD-GC and FID-GC is 1 mL . The flow rate of the $\mathrm{CO}_{2}$ gas in the system is 30 $\mathrm{mL} / \mathrm{min}$.
