## General Information

All operations were carried out under air atmospheres. NMR spectra were recorded on standard FT spectrometers at ambient probe temperatures ( 500 MHz ) or $298 \mathrm{~K}(400 \mathrm{MHz})$. Chemical shifts ( $\delta / \mathrm{ppm}$ ) were generally referenced to solvent signals: ${ }^{1} \mathrm{H}$, residual $\mathrm{CHCl}_{3}$ (7.26), ac-etone- $d_{5}$, (2.05), or $\mathrm{CHD}_{2} \mathrm{CN}(1.94) ;{ }^{13} \mathrm{C}, \mathrm{CDCl}_{3}$ (77.16) or acetone- $d_{6}$ (29.84). IR spectra were recorded on a Shimadzu IRAffinity-1 spectrometer (Pike MIRacle ATR system, diamond/ZnSe crystal). Capillary thermolyses were monitored with an Optimelt MPA 100 instrument. Microanalyses were conducted by Atlantic Microlab. HPLC analyses were carried out with a Shimadzu instrument package (pump/autosampler/detector LC-20AD/SIL-20A/SPD-M20A).

The di- $t$-butyl azodicarboxylate ( $98 \%$, Aldrich) was recrystallized from heptane (warm until dissolved) and petroleum ether $\left(30-60^{\circ} \mathrm{C}\right.$; added cold and sample kept at room temperature until precipitation). The ( $E$ )-cinnamaldehyde, 4-formylbenzoic acid methyl ester, nicotinic acid, 2-methoxynicotinic acid, 6-aminonicotinic acid, 6-chloronicotinic acid, 6-methylnicotinic acid, isonicotinic acid, picolinic acid, 3-(dimethylamino)benzoic acid, 2-pyridinesulfonic acid, ammonium acetate, $N . N$-dimethylaniline, dimethyl malonate, diethyl malonate, di- $t$-butyl malonate, $\mathrm{Ph}_{2} \mathrm{SiMe}_{2}$, trans- $\beta$-nitrostyrene, and routine chemicals not specifically noted were used as received from common commercial sources.

## Syntheses of nitroolefin substrates

Nitroolefins $6 \mathrm{a}-\mathrm{d}$ and $\mathbf{6} \mathrm{h}-\mathrm{k}$ were used from a previous work, in which they were prepared by Henry reactions with nitromethane. ${ }^{\text {S1 }}$ Nitroolefins $\mathbf{6 f , n}$ were available commercially, and $\mathbf{6 e}, \mathbf{1}$, m were synthesized by literature procedures. ${ }^{\text {s } 2}$
trans-p-(methoxycarbonyl)- $\beta$-nitrostyrene ( 6 g ). ${ }^{53} \mathrm{~A}$ round-bottom flask was charged with 4-formylbenzoic acid methyl ester ( $0.250 \mathrm{~g}, 1.52 \mathrm{mmol}, 1.0$ equiv), nitromethane ( 1.5 mL ), and ammonium acetate $(0.035 \mathrm{~g}, 0.457 \mathrm{mmol}, 30 \mathrm{~mol} \%)$. The mixture was refluxed ( 2 h ) and allowed to cool. The thick slurry was transferred to a sintered glass frit, and the solvent was pulled through by vacuum. The residue was triturated with a minimal amount of methanol, and
the solid transferred to a vial and dried by oil pump vacuum ( $\mathrm{rt}, 14 \mathrm{~h}$ ) to give $\mathbf{6 g}$ as a yellowgreen solid ( $0.124 \mathrm{~g}, 0.598 \mathrm{mmol}, 39 \%$ ), $\mathrm{mp} 178.4-181.8^{\circ} \mathrm{C}$ (open capillary). A round-bottom flask was charged with ( $E$ )-cinnamaldehyde ( $0.25 \mathrm{~mL}, 2.0 \mathrm{mmol}, 1.0$ equiv), nitromethane ( 1.5 mL ), and ammonium acetate $(0.046 \mathrm{~g}, 0.595 \mathrm{mmol}, 30 \mathrm{~mol} \%)$. The mixture was refluxed ( 2 h ) and allowed to cool. The solvent was removed by rotary evaporation. The red oily residue was dissolved in a minimum of DCM, and loaded onto a silica column that was packed and eluted with EtOAc/hexanes (15:85 $\mathrm{v} / \mathrm{v})$. The solvent was removed from the combined product containing fractions by rotary evaporation and oil-pump vacuum ( $\mathrm{rt}, 14 \mathrm{~h}$ ) to give 60 as an oily residue that slowly became a vermillion semi-solid $(0.174 \mathrm{~g}, 1.00 \mathrm{mmol}, 50 \%) .{ }^{\mathrm{s} 4}$
