Supplemental Figure 1. A sequence alignment of N-term Rep proteins used in this study. TYLCV secondary structure as characterized in 1L5I PDB and conserved motifs are shown.

Supplemental Figure 2.

Supplemental Figure 2. Peptide analysis of the $2 \mu \mathrm{~s}$ peptide MD simulation. (A), C $\alpha-\mathrm{RMSD}$ over the length of the simulation. (B), Rg (radius of gyration over the length of the simulation). (C), root mean square fluctuations (RMSF) per residue, A147 removed from the rest as there is 47 residues compared to the $\sim 20$ residues for each other peptide. (D), number of hydrogen bonds in total per peptide. (E), number of residues in a secondary structure confirmation per peptide ( $\alpha$ Helix $+\beta$-Sheet $+\beta$-Bridge + Turn). The 18 peptides are divided up into 3 figures each within each panel: peptides A22 (black), A40 (red), A46 (green), A59 (blue), A64 (orange), and A84 (purple) (top); A99 (black), A116 (green), A127 (blue), A132 (orange), and A135 (purple) (middle); and A147 (black), A155 (red), A159 (green), A160 (blue), A176 (orange), and TRXGST (purple) (bottom). Raw data is shown in grey lines while colored lines are the running averages in panels A and B.

Supplemental Figure 3.

Supplemental Figure 3. Free energy landscape analysis of the $2 \boldsymbol{\mu}$ s peptide MD simulation. Peptides A22 (A), A40 (B), A46 (C), A59 (D), A64 (E), A84 (F), A99 (G), A116 (H), A127 (I), A132 (J), A135 (K), A147 (L), A155 (M), A159 (N), A160 (O), A176 (P), and TRX-GST (Q) FEL analysis. The FEL values are constructed as a function of projections of the MD trajectory onto their own $\mathrm{C} \alpha-\mathrm{RMSD}$ and $\mathrm{C} \alpha-\mathrm{Rg}$ values, respectively. The color bar represents the relative free-energy value in $\mathrm{kcal} \mathrm{mol}^{-1}$.

Supplemental Figure 4.

Supplemental Figure 4. Peptide secondary structure analysis during the $\mathbf{2} \boldsymbol{\mu s} \mathbf{M D}$ simulation. Peptides A22 (A), A40 (B), A46 (C), A59 (D), A64 (E), A84 (F), A99 (G), A116 (H), A127 (I), A132 (J), A135 (K), A147 (L), A155 (M), A159 (N), A160 (O), A176 (P), and TRX-GST (Q) secondary structure analysis. Color output from DSSP: coil (white), $\beta$-sheet (red), $\beta$-bridge (black), bend (green), turn (yellow), $\alpha$-helix (blue), 5 -helix (purple), and $3^{10}$-helix (grey).

Supplemental Figure 5.

Supplemental Figure 5. N-term Rep model analysis of the 500 ns protein MD simulation. (A) $\mathrm{C} \alpha-\mathrm{RMSD}$, (B) the radius of gyration ( Rg ), and (C) the C $\alpha$-RMSF per residue values over the length of the simulation. The lines are panels A-C are colored according to: AMCV (black), BCTV (red), CalCuV (green), CLCBuV (blue), EACMV (yellow), MSV (magenta), TGMV (purple), TYLCV (cyan), and ToMoV (orange). Raw data is shown in grey lines while colored lines are the running averages.

Supplemental Figure 6.

Supplemental Figure 6. Solvent accessibility surface area average and standard deviation as calculated through GROMACS over the length of the $2 \mu \mathrm{~s}$ MD simulation per residue in $\mathbf{N}$ term Rep models. From top to bottom: AMCV (black), BCTV (red), CLCBuV (green), CalCuV (blue), EACMV (yellow), MSV (magenta), TGMV (purple), TYLCV (cyan), and ToMoV (orange). Standard deviation is shown in light grey. Areas of notable difference of CalCuV and TGMV in comparison with the rest of the N -term Rep models are highlighted in grey.

## Supplemental Figure 7.

Supplemental Figure 7. 3D bubble chart protein and peptide Z-score interaction pairs. Each bubble represents an interaction between A22 (top) or A64 (bottom) with the protein of interest. The larger the bubble the bigger the Z-score and significance of the interaction. Sequences were aligned according to the alignment in Supplemental Figure S1. Legends for each chart are provided for clarity.

## Supplemental Tables
