Figure S3. DFT calculated potential energy surface (PES) for Mukaiyama aldol reaction. Energies were obtained at B3LYP/6-31G(d,p) level of theory.

The intermolecular Mukaiyama aldol reaction between $\mathbf{8}$ and $\mathbf{1 1}$ catalyzed by 0.1 equiv TMSOTf in DCM was followed by the $\mathrm{EtAlCl}_{2}$-mediated Sakurai reaction in the same reaction flask, affording two major products, $\mathbf{7 a}$ and $\mathbf{7 b}$, as a $2: 1$ mixture. In order to rationalize the diastereoselectivity, we performed preliminary density functional theory (DFT) calculations and located two competing synclinal open transition states $\mathbf{T S}_{\mathbf{a}}$ and $\mathbf{T S}_{\mathbf{b}}$ with minimized gauche interactions between the OTMS moiety and the substituents on the oxocarbenium (Figure S3); ${ }^{[5]}$ the facial selectivity of silyl enol ether was dictated by the Fürst-Plattner rule. ${ }^{[6]}$ In agreement with the experimentally observed diastereoselectivity (assuming the similar efficiency of intramolecular Sakurai cyclizations), $\mathbf{T S}_{\mathbf{a}}$ is favored over $\mathbf{T S}_{\mathbf{b}}$ by $0.7 \mathrm{kcal} / \mathrm{mol}$, which could be expected from the pseudo-axial occupation of the bulky propenyl group in TS ${ }_{\text {b }}$.

## II. Experimental Procedures and Spectroscopic Data

## General Information

Unless otherwise mentioned, all reactions were carried out under a nitrogen atmosphere with dry solvents under anhydrous conditions. All the chemicals were purchased commercially, and used without further purification. Anhydrous THF and ether were distilled from sodium-benzophenone, toluene was distilled from sodium, and dichloromethane was distilled from calcium hydride. Yields refer to chromatographically. Reagents were purchased at the highest commercial quality and used without further purification, unless otherwise stated.

Reactions were monitored by thin layer chromatography (TLC) carried out on 0.25 mm E. Merck silica plates ( $60 \mathrm{~F}-254$ ), using UV light as the visualizing agent and an ethanolic solution of ammonium molybdate and heat, or $\mathrm{KMnO}_{4}$ and heat as developing agents. If not specially mentioned, flash column chromatography uses silica gel (200-300 mesh) supplied by Tsingtao Haiyang Chemicals (China).

## Synthesis of compound S1

The procedure was modified from the reported protocol. ${ }^{[10,11]}$
To a solution of 2,2-dimethylcyclopentanedione ( $10.0 \mathrm{~g}, 79.2 \mathrm{mmol}, 1.00$ equiv) in toluene ( 160 mL ) was added $(R)$-oxazaborolidine ( $31.7 \mathrm{~mL}, 1 \mathrm{M}$ in toluene, 31.7 $\mathrm{mmol}, 0.40$ equiv) and $\mathrm{PhNEt}_{2}(6.30 \mathrm{~mL}, 39.6 \mathrm{mmol}, 0.50$ equiv). The reaction mixture was cooled to $-60^{\circ} \mathrm{C}$, then a solution of catecholborane ( $111 \mathrm{~mL}, 1 \mathrm{M}$ in toluene, $111 \mathrm{mmol}, 1.40$ equiv) was added with syring pump over 2 h . The reaction was stirred for 30 min at the same temperature, and then quenched with $\mathrm{MeOH}(30$ $\mathrm{mL})$. The mixture was allowed to warm to room temperature and diluted with $\mathrm{Et}_{2} \mathrm{O}$ $(200 \mathrm{~mL})$. Then saturated aq. $\mathrm{NaHCO}_{3}(100 \mathrm{~mL})$ and 3 M NaOH aqueous solution $(100 \mathrm{~mL})$ were added to the flask. The mixture was stirred vigorously for 1 h . The layers were separated and the aqueous phase was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 250 \mathrm{~mL})$. The combined organic layers were washed with $\mathrm{H}_{2} \mathrm{O}(200 \mathrm{~mL}), 0.5 \mathrm{M} \mathrm{HCl}$ aqueous solution ( 80 mL ) and brine, and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Then $\mathrm{Et}_{2} \mathrm{O}$ was removed under vacuum. The resulting solution was loaded onto a silica gel and flushed with PE to remove toluene, and then purified by flash column chromatography on silica gel $\left(\mathrm{Et}_{2} \mathrm{O} / \mathrm{PE}=1 / 5\right.$ to $\left.2 / 1\right)$ to give compound $\mathbf{S} 1(5.14 \mathrm{~g}, 40.1 \mathrm{mmol}, 83 \%$ ee) as a colorless oil in $51 \%$ yield.

The characterization data are consistent with those reported in the literature. ${ }^{[10, ~ 11]}$

## Synthesis of compound (+)-4

To a solution of compound (+)-12 ( $4.00 \mathrm{~g}, 12.0 \mathrm{mmol}, 1.00$ equiv) in DCM $(240 \mathrm{~mL})$ was added $\mathrm{NaHCO}_{3}(10.1 \mathrm{~g}, 120 \mathrm{mmol}, 10.0$ equiv) and DMP ( $10.2 \mathrm{~g}, 24.0$ mmol, 2.00 equiv) at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was allowed to stir for 4 h at the same temperature, then was quenched with saturated aq. $\mathrm{Na}_{2} \mathrm{SO}_{3}(400 \mathrm{~mL})$ diluted with $\mathrm{H}_{2} \mathrm{O}(200 \mathrm{~mL})$. The layers were separated and the aqueous phase was extracted with EtOAc $(3 \times 200 \mathrm{~mL})$. The combined organic layers were washed with 0.5 M NaOH aqueous solution $(3 \times 240 \mathrm{~mL}), \mathrm{H}_{2} \mathrm{O}(150 \mathrm{~mL})$ and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo to obtain crude $\mathbf{6}$ that was used without purification.

The residue of crude $\mathbf{6}$ was dissolved in DCM ( 320 mL ). Pyridine ( $2.84 \mathrm{~mL}, 36.0$ mmol, 3.00 equiv) and $\mathrm{Tf}_{2} \mathrm{O}$ ( $3.00 \mathrm{~mL}, 18.0 \mathrm{mmol}, 1.50$ equiv) were added sequentially at $0{ }^{\circ} \mathrm{C}$. Subsequently, ${ }^{i} \mathrm{PrOH}$ ( $2.76 \mathrm{~mL}, 36 \mathrm{mmol}, 3.00$ equiv) was added to the flask and the solution was concentrated in vacuo and azeotroped with toluene ( $3 \times 30 \mathrm{~mL}$ ). The residue was dissolved in DCE ( 400 mL ) and 4-Ph-pyridine ( $2.80 \mathrm{~g}, 18.0 \mathrm{mmol}, 1.50$ equiv) was added. The reaction mixture was allowed to stir for 14 h at $80{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ atmosphere. DCE was removed under vacuum, the residue was diluted with $\mathrm{H}_{2} \mathrm{O}(400$ $\mathrm{mL})$, and the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 200 \mathrm{~mL})$. The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. ## Synthesis of (-)-grayanotoxin III (1)

(+)-22a

(-)-Grayanotoxin III (1)

The solution of compound (+)-22a ( $16.0 \mathrm{mg}, 0.0434 \mathrm{mmol}, 1.00$ equiv) and $\mathrm{Mn}(\mathrm{dpm})_{3}(5.2 \mathrm{mg}, 0.00869 \mathrm{mmol}, 0.20$ equiv) in DCM ( 1.2 mL ) was degassed by bubbling $\mathrm{N}_{2}$ through the solution for 10 min . TBHP $(12 \mu \mathrm{~L}, 5.5 \mathrm{M}$ in decane, 0.0651 mmol, 1.50 equiv) and $\mathrm{Ph}\left({ }^{i} \mathrm{PrO}\right) \mathrm{SiH}_{2}$ ( $19.5 \mu \mathrm{~L}, 0.108 \mathrm{mmol}, 2.50$ equiv) were added sequentially at room temperature. The mixture was degassed again by bubbling $\mathrm{N}_{2}$ through the solution for 1 min . Then the flask was moved into a glove box and the reaction mixture was stirred for 27 h at room temperature in the glove box under $\mathrm{N}_{2}$ atmosphere. The flask was removed from the glove box and the mixture was concentrated in vacuo. The residue was purified by preparative Thin-Layer Chromatography on silica gel ( $\mathrm{DCM} / \mathrm{MeOH}=1 / 7$ ) to give $(-)$-grayanotoxin III (1) $(8.2 \mathrm{mg}, 0.0221 \mathrm{mmol}$ ) as a white solid in $51 \%$ yield ( $64 \% \mathrm{brsm}$ ) and recover compound (+)-22a ( $3.2 \mathrm{mg}, 0.00869 \mathrm{mmol}$ ) as a white solid.

## Synthesis of (+)-principinol E (2)

To a solution of compound (-)-24 ( $8.0 \mathrm{mg}, 0.0142 \mathrm{mmol}, 1.00$ equiv) in THF $(1.4 \mathrm{~mL})$ was added (trimethylsilyl)methyllithium solution $(0.26 \mathrm{~mL}, 0.55 \mathrm{M}$ in hexane, $0.142 \mathrm{mmol}, 10.0$ equiv) at $0{ }^{\circ} \mathrm{C}$ and then stirred for 10 min at the same temperature. The reaction mixture was quenched with saturated aq. $\mathrm{NaHCO}_{3}(2 \mathrm{~mL})$ diluted with EtOAc ( 2 mL ). The layers were separated and the aqueous phase was extracted with EtOAc ( $3 \times 3 \mathrm{~mL}$ ). The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo.

The residue was dissolved in THF ( 1.2 mL ), and then $\mathrm{LiEt}_{3} \mathrm{BH}(0.20 \mathrm{~mL}, 1.0 \mathrm{M}$ in THF, $0.198 \mathrm{mmol}, 14.0$ equiv) was added at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred for 1 h at the same temperature, and quenched with saturated aq. $\mathrm{NaHCO}_{3}(2 \mathrm{~mL})$ diluted with EtOAc ( 2 mL ). The layers were separated and the aqueous phase was extracted with EtOAc ( $3 \times 3 \mathrm{~mL}$ ). The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was briefly purified by flash column chromatography on silica gel ( $\mathrm{EtOAc} / \mathrm{PE}=1 / 10$ to $1 / 2$ ) to give crude product.

The residue of the crude product above was dissolved in 1,4-dioxane ( 1.0 mL ) followed by the addition of $2 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$ aqueous solution ( 0.6 mL ). The reaction mixture was stirred for 20 h at room temperature, and quenched with saturated aq. $\mathrm{NaHCO}_{3}(2 \mathrm{~mL})$ diluted with $\mathrm{EtOAc}(2 \mathrm{~mL})$. The layers were separated and the aqueous phase was extracted with $\operatorname{EtOAc}(5 \times 4 \mathrm{~mL})$. The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was purified by preparative Thin-Layer Chromatography on silica gel (EtOAc) to give (+)-principinol E (2) ( $3.7 \mathrm{mg}, 0.0111 \mathrm{mmol}$ ) as a white solid in $78 \%$ yield over 3 steps.

## Syntheses of (-)-rhodomollein XX (3) and (-)-3-epi-rhodomollein XX (28)

To the solution of compound (+)-26 ( $18.0 \mathrm{mg}, 0.0514 \mathrm{mmol}, 1.00$ equiv) in THF ( 5.6 mL ) was added NaHMDS ( 2.0 M in THF, $0.28 \mathrm{~mL}, 0.56 \mathrm{mmol}, 11.0$ equiv) at $78{ }^{\circ} \mathrm{C}$, and stirring was continued at the same temperature for 2.5 h . Subsequently, to the reaction mixture was added a solution of ( $\pm$ )-trans-2-(phenylsulfonyl)-3-phenyloxaziridine ( $161 \mathrm{mg}, 0.619 \mathrm{mmol}, 12.0$ equiv) in THF ( 1 mL ) at the same temperature, and stirring was continued for further 2 h . The reaction mixture was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(5 \mathrm{~mL})$ diluted with EtOAc ( 5 mL ). The layers were separated and the aqueous phase was extracted with EtOAc $(6 \times 10 \mathrm{~mL})$. The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was briefly purified by passing through a short column of silica gel (eluted by $\mathrm{DCM} / \mathrm{MeOH}=1 / 30$ to $1 / 7$ ) to give crude $27(10.0 \mathrm{mg}, 0.0273 \mathrm{mmol})$ as a white foam.

The residue obtained above was dissolved in $\mathrm{MeOH}(1.8 \mathrm{~mL})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}$ (3.8 $\mathrm{mg}, 0.0273 \mathrm{mmol}, 1.00$ equiv) was added in one portion at room temperature. The reaction mixture was stirred for 1.5 h at the same temperature, and then quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(3 \mathrm{~mL})$ diluted with $\mathrm{EtOAc}(5 \mathrm{~mL})$. The layers were separated and the aqueous phase was extracted with EtOAc ( $6 \times 5 \mathrm{~mL}$ ). The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was purified by preparative Thin-Layer Chromatography on silica gel $(\mathrm{DCM} / \mathrm{MeOH}=1 / 7)$ to give a mixture of (-)-rhodomollein XX (3) and (-)-3-epi-rhodomollein XX (28) ( $5.8 \mathrm{mg}, 0.0158 \mathrm{mmol},{ }^{1} \mathrm{H}-\mathrm{NMR}$ ratio $\left.\mathbf{3 : 2 8}=1: 1.3\right)$ in $31 \%$ yield over 2 steps.

## Protection followed by deprotection to afford pure (-)-rhodomollein XX (3) and (-)-3-epi-rhodomollein XX (28)

To a solution of the mixture of (-)-rhodomollein XX (3) and (-)-3-epi-rhodomollein III (28) ( $5.8 \mathrm{mg}, 0.0158 \mathrm{mmol},{ }^{1} \mathrm{H}-\mathrm{NMR}$ ratio $\mathbf{3 : 2 8}=1: 1.3$, 1.00 equiv) in THF ( 1.5 mL ) was added $\mathrm{Et}_{3} \mathrm{~N}(4.4 \mu \mathrm{~L}, 0.0316 \mathrm{mmol}, 2.00$ equiv) followed by TBSOTf ( $4.7 \mu \mathrm{~L}, 0.0205 \mathrm{mmol}, 1.30$ equiv) at $-40^{\circ} \mathrm{C}$. The reaction mixture was stirred at the same temperature for 10 min , and then was quenched with saturated aq. $\mathrm{NaHCO}_{3}(2 \mathrm{~mL})$ diluted with EtOAc ( 2 mL ). The layers were separated and the aqueous phase was then extracted with EtOAc ( $4 \times 5 \mathrm{~mL}$ ). The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was purified by preparative Thin-Layer Chromatography on silica gel (hexane/EtOAc $=1 / 1$ ) to give compound $\mathbf{S 3}(\sim 3 \mathrm{mg})$ as a white foam and give compound $\mathbf{S 4}(\sim 3 \mathrm{mg})$ as a white foam.

To a solution of compound $\mathbf{S 3}$ in THF ( 0.15 mL ) and $\mathrm{MeOH}(0.15 \mathrm{~mL})$ was added 2 M HCl aqueous solution $(75 \mu \mathrm{~L})$. The reaction mixture was stirred for 10 min at $15{ }^{\circ} \mathrm{C}$, and was quenched with saturated aq. $\mathrm{NaHCO}_{3}$ diluted with EtOAc ( 3 mL ). The layers were separated and the aqueous phase was extracted with EtOAc ( $6 \times 3 \mathrm{~mL}$ ). The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was purified by preparative Thin-Layer Chromatography on silica gel ( $\mathrm{DCM} / \mathrm{MeOH}=1 / 7$ ) to give $(-)$-rhodomollein $\mathrm{XX}(3)$ $(1.8 \mathrm{mg}, 0.00491 \mathrm{mmol})$ as a white solid in $31 \%$ yield over 2 steps.

To a solution of compound $\mathbf{S 4}$ in THF $(0.15 \mathrm{~mL})$ and $\mathrm{MeOH}(0.15 \mathrm{~mL})$ was added 2 M HCl aqueous solution ( $75 \mu \mathrm{~L}$ ). The reaction mixture was stirred for 10 min at $15{ }^{\circ} \mathrm{C}$, and was quenched with saturated aq. $\mathrm{NaHCO}_{3}$ diluted with EtOAc ( 3 mL ). The layers were separated and the aqueous phase was extracted with EtOAc ( $6 \times 3 \mathrm{~mL}$ ). The combined organic layers were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was purified by preparative Thin-Layer Chromatography on silica gel ( $\mathrm{DCM} / \mathrm{MeOH}=1 / 7$ ) to give $(-)$-3-epi-rhodomollein XX (28) ( $2.0 \mathrm{mg}, 0.00546 \mathrm{mmol}$ ) as a white solid in $34 \%$ yield over 2 steps.

There has been only one reported isolation of rhodomollein XX by Li et al., ${ }^{[9]}$ which reported the optical rotation: $[\alpha]_{\mathrm{D}}^{25}+8.6$ (c 0.1 EtOH ). However, the sign of our optical rotation was opposite to that reported by Li et al.: $[\boldsymbol{\alpha}]_{\boldsymbol{D}}^{17}-45.7(c 0.1 \mathrm{EtOH})$. We determines absolute configuration based on the established stereochemistry of $\mathbf{9},{ }^{[13]}$ as well as the X-ray crystallography of synthetic intermediate $\mathbf{1 4}$, which is further supported by the X-ray crystallography of other related compounds (such as 22b and 23b). The discrepancy in the sign of the optical rotation may have been a tabulation error, or due to a minor impurity.

## IV. DFT Calculation

Density functional theory (DFT) calculations was carried out using Gaussian 09 D. 01 software package. ${ }^{[17]}$ Geometry optimizations were performed with B3LYP functional using $6-31 \mathrm{G}(\mathrm{d}, \mathrm{p})$ basis set for all atoms. Vibrational frequencies were computed at the same level of theory as geometry optimizations, and to make sure no imaginary frequency was found on the minima of potential energy surface.
