Figure S1. SEM images of commercial AAO templates with pore sizes $\sim 150-400 \mathrm{~nm}$ : (a) lower magnification and (b) higher magnification.

Figure S2. SEM images of polymer nanomaterials: (a) PMMA ( $M_{\mathrm{w}}: 97 \mathrm{~kg} / \mathrm{mol}$ ) nanotubes prepared from a 5 wt \% PMMA solution in acetic acid, (b) PMMA nanotubes after the PMMA sample is immersed in cyclohexane for 24 h , (c) PS ( $M_{\mathrm{w}}: 35 \mathrm{~kg} / \mathrm{mol}$ ) nanotubes prepared from a $5 \mathrm{wt} \%$ PS solution in DMF, and (d) PS nanotubes after the PS sample is immersed in acetic acid for 24 h .

Figure S3. SEM images of PS ( $M_{\mathrm{w}}: 78.5 \mathrm{~kg} / \mathrm{mol}$ ) nanospheres and nanorods. The samples are first prepared by dipping AAO templates in PS solutions in DMF with different concentrations, followed by immersing the samples in $10 \mathrm{wt} \%$ PMMA solutions in acetic acid. After the samples are dried, PMMA is removed selectively by acetic acid. The AAO templates are then dissolved by $\mathrm{NaOH}_{(\mathrm{aq})}$ to release the polymer nanostructures. The concentrations of the PS solutions are (a) 5, (b) 10, (c) 20, and (d) $30 \mathrm{wt} \%$.

Figure S4. SEM images of synthesized AAO templates with pore sizes $\sim 50 \mathrm{~nm}$ : (a) lower magnification and (b) higher magnification.

Figure S5. (a) SEM image of peapod-like PS ( $M_{\mathrm{w}}: 35 \mathrm{~kg} / \mathrm{mol}$ ) /PMMA ( $M_{\mathrm{w}}: 97 \mathrm{~kg} / \mathrm{mol}$ ) nanostructures. (b) SEM image of the PS nanospheres after the PMMA is removed selectively by acetic acid. (c) TEM image of a peapod-like PS/PMMA nanostructure. (d) TEM image of a PS nanosphere after the PMMA is removed selectively by acetic acid. The samples are obtained using synthesized AAO templates with pore diameters $\sim 50 \mathrm{~nm}$.
