Conformational analysis

The conformers of all tetraene substrates have been considered at the M06-2X/6-31+G(d,p) level of theory; for each reaction, the barrier is determined using the global minimum tetraene conformer. The 1,3,5-cyclooctatrienes as well as the resulting 6π electrocyclization transition states described in our manuscripts feature a twist-boat conformation. For the parent 1,3,5-cyclooctatriene, two enantiomeric twist-boat conformers exist.¹¹ For 1,3,5-cyclooctatrienes that possess a center of chirality, these two conformers as well as the related 6π electrocyclization transition state conformers are diastereomeric structures. In these cases, both conformers have been computed, and the lowest energy conformer of all stationary points are depicted and discussed in the manuscript. To illustrate these different conformations, *exo* and *endo* transition state conformers of 6π ring closure of **2COT** are shown below in Figure S1 below.

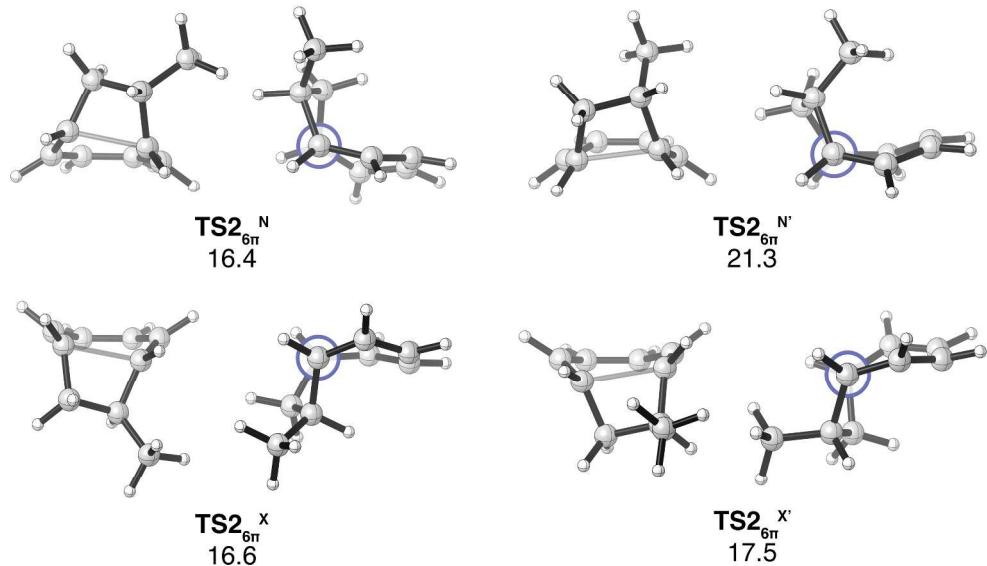

Figure S1. M06-2X/6-31+G(d,p) optimized structures of all *exo* and *endo* transition states of the 6π ring closures of **2COT**.

¹ For further details regarding the conformations of 1,3,5-cyclooctatriene, see: Anet, F.; Yavari, I. *Tetrahedron Lett.* **1975**, *48*, 4221–4224.

Influence of donor or acceptor substituents on the 8π - 6π electrocyclization cascade

In the main text, we focus on the influence of alkyl substituents on the 8π - 6π electrocyclic reaction of tetraenes, considering the fact that a large majority of the natural products presented in Scheme 2 feature analogous substituents at the 7 and 8 positions of their bicyclo[4.2.0]2,4-octadiene skeletons (Scheme 2 of the main text). Here, we summarize the results for the 8π - 6π ring closures of fluorinated 1,3,5,7-tetraenes **2F** and **3F** as well as formylated tetraenes **2CHO** and **3CHO**. These substrates were chosen because they feature strong donor (fluorine) and acceptor (formyl) substituents.

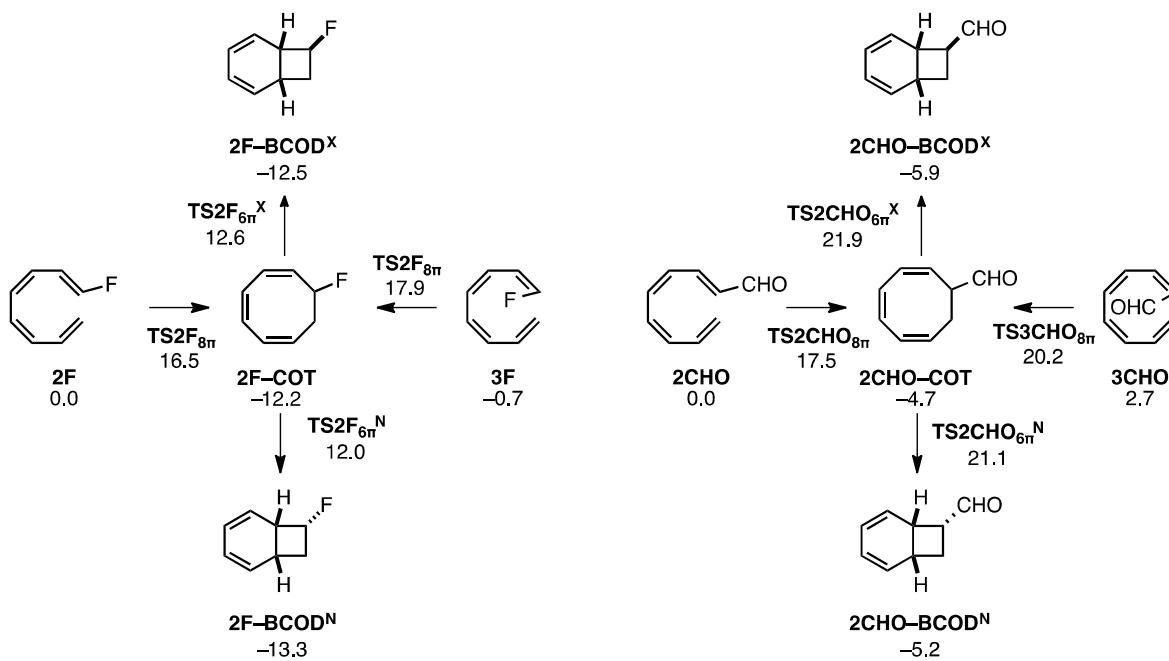

Figure S2. Summary of the M06-2X/6-31+G(d,p) computations of the 8π - 6π electrocyclization cascades of the 1-fluoro (**2F** and **3F**) and 1-formyl (**2CHO** and **3CHO**) substituted 1,3,5,7-octatetraenes.

Houk and coworkers performed an *ab initio* computational study of the influence of donor and acceptor substituents of the reactivity and torquoselectivity of tetraene ring closures by modeling the 8π ring closures of *cis* and *trans*-1-fluoro-1,3,5,7-octatetraenes and *cis* and *trans*-1-formyl-1,3,5,7-

octatetraenes.²² They found that both donor influence of both donors and acceptors only have a modest effect on the reactivity. However, the influences of classic donors and acceptors the 6π electrocyclizations step of these cascade reactions have yet to be modeled computationally. We expect that such effects are small as the terminal substituents of the tetraene precursors are no longer in conjugation with π system of the reacting cyclooctatrienes shown in Figure S2.

Shown below are the results of M06-2X/6-31+G(d,p) computations of the 8π - 6π cascades of the fluoro and formyl-substituted tetraenes. Neither the fluoro- nor the formyl substituent has a significant effect on the ΔG^\ddagger for 8π electrocyclization: these 8π ring closures have only slightly higher computed ΔG^\ddagger (ca 1 kcal mol⁻¹) than the analogous respectively, similar reactions of tetraenes **2** and **3**. The rate-determining step for the cascade reactions is the second (6π) electrocyclization. The ΔG^\ddagger values for the 8π - 6π ring closures of **2F** (and **3F**) and **2CHO** (and **3CHO**) are 24 kcal mol⁻¹ and 26 kcal mol⁻¹, respectively. These ΔG^\ddagger values are similar to the ΔG^\ddagger value (ca. 25 kcal mol⁻¹) of the reaction of the hydrocarbon substrate **2**.

Both the *endo* and the *exo* modes of the 6π ring closures of **2F-COT** are slightly more facile than the corresponding ring closure of **2COT**. The fluorine substituent, likely due to its smaller size, destabilizes both the intermediate and the 6π transition states to a lesser extent than does the methyl substituent of **2COT**. Also in contrast to the reaction of the methylated analogue of **2F**, a slight kinetic and thermodynamic preference is observed for the formation of *endo* diastereomer of the bicyclo[4.2.0]octadiene product.

The 8π electrocyclization of **2CHO** is 5 kcal mol⁻¹ less exergonic than the analogous reaction of **2**. This is due to a difference in the stability of the tetraene precursors **2CHO** and **2**. The formyl substituent of tetraene **2CHO** is in conjugation with the π system of the tetraene, whereas the methyl group of **2** cannot interact with the π system in this way. This resonance effect also stabilizes the 8π

² Thomas, B. E.; Evanseck, J. D.; Houk, K. N. *J. Am. Chem. Soc.* **1993**, *115*, 4165–4169.

transition states to some extent. As a result of this stabilizing effect, transition states, and products that follow the 8π transition state shown in the diagram above are higher in relative energy than their analogs for the 1-methyl substrate **2**.

Discussion of the B3LYP/6-31G(d) study of the 8π - 6π electrocyclizations of tetraenes 1-10

Table S1. Summary of B3LYP/6-31G(d) computed activation and reaction free energies for cascade ring closures of tetraenes **1-10**.

Tetraene	$\Delta G_{8\pi}^{\ddagger}$ ^a	$\Delta G_{8\pi}^b$ ^b	$\Delta G_{6\pi}^{\ddagger}$ ^a	$\Delta G_{6\pi}^{b,c}$ ^{b,c}	$\Delta \Delta G_{6\pi}^{\ddagger}$ ^d
1 	19	-4	23	-2	N/A
2 	20	0	25	0	0
3 	21	-2	22	-2 (<i>exo</i>)	0
4 	24	3	27	2	N/A
5 	21	6	27	3	N/A
6 	16	0	21	-3	N/A
7 	22	7	27	2 (<i>endo</i>)	4
8 	27	13	30	7 (<i>exo</i>)	5
9 	25	11	29	4 (<i>endo</i>)	5
10 	33	20	40	11	N/A

All Gibbs free energies are reported in kcal mol⁻¹ and were calculated using the tetraene precursor as the point of reference. ^a $\Delta G_{8\pi}^{\ddagger}$ and $\Delta G_{6\pi}^{\ddagger}$ are the free energies of activation for 8π and 6π ring closure of the indicated tetraene, respectively. ^bThe reaction energies for the 8π and 6π electrocyclizations are, respectively, $\Delta G_{8\pi}$ and $\Delta G_{6\pi}$. ^cThe exo and endo designations indicate which of the two stereoproducts is more stable (where relevant). ^dFree energy difference between the endo and exo 6π ring closure transition states.

In comparison with M06-2X/6-31+G(d,p), the B3LYP/6-31G(d) level of theory performs poorly in two regards. The B3LYP/6-31G(d) model chemistry fails to accurately reproduce the thermodynamics of the electrocyclizations. The 8π - 6π electrocyclization cascades of **2**, **5**, **6**, and **7** are experimentally known to be exergonic. B3LYP/6-31G(d) computations erroneously predict the cascade reactions of **2**, **5**, **6**, and **7** are endergonic or thermonetral. A similar argument can be made for **8**, which resembles, in terms of substitution pattern, naturally occurring trisubstituted tetraenes, although the kinetics and thermodynamics for the electrocyclization cascade of this substrate have not been studied experimentally. The failure of B3LYP to accurately reproduce the thermodynamics of π to σ transformations is documented.³ Secondly, the activation free energies of the 8π electrocyclic reaction of **2**, **5**, and **7** are slightly overestimated compared with experimental data.⁴ The B3LYP/6-31G(d) level of theory, despite its shortcomings, does predict a level of diastereoselectivity for the 6π electrocyclic reactions of **7COT**, **8COT**, and **9COT** in agreement with the M06-2X/6-31+G(d,p) computations.

³ Pieniazek, S. N.; Clemente, F. R.; Houk, K. N. *Angew. Chem. Int. Ed.* **2008**, *47*, 7746–7749.

⁴ The B3LYP/6-31G(d) model chemistry performs admirably in recapitulating experimental activation enthalpies of hydrocarbon pericyclic reactions; at this level of theory such values are slightly overestimated ($MAD = 2 \text{ kcal mol}^{-1}$). See: Guner, V.; Khuong, K. S.; Leach, A. G.; Lee, P. S.; Bartberger, M. D.; Houk, K. N. *J. Phys. Chem. A* **2003**, *107*, 11445–11459.
