## 1. General Information

Unless otherwise stated, reactions were carried out under argon atmosphere in solvents dried by passing through an activated alumina column on a PureSolv ${ }^{\mathrm{TM}}$ solvent purification system (Innovative Technologies, Inc., MA). Analytical thin layer chromatography was carried out using TLC-aluminium sheets with 0.2 mm of silica gel (Merck $\mathrm{GF}_{234}$ ) using UV light as the visualizing agent and an acidic solution of vanillin or anisaldehyde in ethanol as the developing agent. Chromatographic purifications were carried out using flash grade silica gel (SDS Chromatogel 60 ACC, 40-63 $\mu \mathrm{m}$ ). Organic solutions were concentrated under reduced pressure on a Büchi rotary evaporator.
NMR spectra were recorded at 298 K on a Bruker Avance 400 Ultrashield and Bruker Avance 500 Ultrashield apparatuses. Mass spectra were recorded on a Waters Micromass LCT Premier (ESI), Waters Micromass GCT (EI, CI) and Bruker Daltonics Autoflex (MALDI) spectrometers. Melting points were determined using a Büchi melting point apparatus.

Crystal structure determinations were carried out using a Bruker-Nonius diffractomer equipped with an APPEX 24 K CCD area detector, a FR591 rotating anode with $\mathrm{MoK}_{\mathrm{a}}$ radiation, Montel mirrors as monochromator and a Kryoflex low temperature device $\left(T=-173^{\circ} \mathrm{C}\right)$. Full-sphere data collection was used with w and j scans. Programs used: Data collection APEX-2, data reduction Bruker Saint V/.60A and absorption correction SADABS. Structure Solution and Refinement: Crystal structure solutions were achieved using direct methods as implement in SHELXTL and visualized using the program XP. Missing atoms were subsequently located from difference Fourier synthesis and added to the atom list. Least-squares refinement on F2 using all measured intensities was carried out using the program SHELXTL. All non-hydrogen atoms were refined including anisotropic displacement parameters. HPLC analysis was carried out in an Agilent Tehcnologies instrument HPLC 1100 series with VWD detector or HPLC 1200 series with DAD detector. The column used was a Chiralpack IC ( 4.6 mm x 250 mm ) eluting with hexane:isopropanol ( $99: 1$ ), $0.85 \mathrm{~mL} / \mathrm{min}$ flow, $5 \mu \mathrm{~L}$ injection and $\lambda=210 \mathrm{~nm}$. 2-methylcyclohexenone, ${ }^{1}$ phosphoramidite L*, ${ }^{2}$ methallyl iodide ${ }^{3}$ and 2-tert-butylpyridine $N$-oxide (PNO6) ${ }^{4}$ were prepared according to the literature whereas the other reagents were purchased from SigmaAldrich or Alfa Aesar. $\mathrm{RhCl}_{3} \cdot x \mathrm{H}_{2} \mathrm{O}$ was purchased from Strem Chemicals.

## 3. Procedures for the synthesis of (-)nardoaristolone $B$ and compounds 8 and 10

## (2S,3R)-2,3-dimethyl-2-(2-methylallyl)cyclohexan-1-one (3)

To a stirred suspension of copper(I)-thiophene-2-carboxylate ( $69 \mathrm{mg}, 0.36 \mathrm{mmol}, 0.02$ equiv) in 15 mL $\mathrm{Et}_{2} \mathrm{O}$ was added ( $R, S, S$ )-(+)-(3,5-dioxa-4-phospha-cyclohepta[2,1-a;3,4-a’]dinaphthalen-4-yl)bis(1phenylethyl) amine ( $392 \mathrm{mg}, 0.72 \mathrm{mmol}, 0.04$ equiv). After stirring for 15 min at $23^{\circ} \mathrm{C}$, the resulting suspension was cooled to $-35^{\circ} \mathrm{C}$ and 2-methylcyclohex-2-en-1-one ( $2.1 \mathrm{~mL}, 18.2 \mathrm{mmol}, 1$ equiv) was added. Subsequently, $\mathrm{AlMe}_{3}$ ( 2 M in heptane, $10.4 \mathrm{~mL}, 20.9 \mathrm{mmol}, 1.15$ equiv) was added slowly over a period of 15 min and allowed to react for 3 h at $-35^{\circ} \mathrm{C}$ (the mixture turns milky bright yellow upon addition of $\mathrm{AlMe}_{3}$ ).

After 3 h at $-35^{\circ} \mathrm{C}$, dry THF ( 15 mL ) and HMPA ( 12 mL ) were added and the mixture allowed to warm to $-5^{\circ} \mathrm{C}$. $\mathrm{MeLi}\left(1.6 \mathrm{M}\right.$ in $\mathrm{Et}_{2} \mathrm{O}, 12.7 \mathrm{~mL}, 20.3 \mathrm{mmol}, 1.07$ equiv) was added dropwise over 5 min from $-5^{\circ} \mathrm{C}$ to $0^{\circ} \mathrm{C}$ (the reaction turns greenish upon addition of MeLi). After 20 min stirring, methallyl iodide ( $3.5 \mathrm{~mL}, 32.7 \mathrm{mmol}, 1.7$ equiv) was slowly added over 5 min . The reaction mixture was left at 0 ${ }^{\circ} \mathrm{C}$ for 30 min and slowly warmed to $23^{\circ} \mathrm{C}$ and left stirring at this temperature for 60 h . The reaction was then quenched with a saturated aqueous solution of potassium sodium tartrate and extracted with dichloromethane $(5 \times 100 \mathrm{~mL})$. The combined organic layers were washed with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(200 \mathrm{~mL})$ and brine ( 200 mL ) and finally dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The volatiles were removed under vacuum and the crude mixture was purified by column chromatography on silica gel eluting with pentane/ $\mathrm{Et}_{2} \mathrm{O} 100: 1$ to $30: 1$ to afford a colorless liquid (3:1 mixture of diastereomers $\mathbf{3}$ and $\mathbf{3}^{\prime}, 1.8 \mathrm{~g}, 10$ mmol, $55 \%$ yield, $90 \%$ ee). The desired diastereomer 3 could be separated after several chromatography columns eluting with pentane/ $\mathrm{Et}_{2} \mathrm{O}$ 80:1 in essentially pure form ( $>30: 1 \mathrm{dr}$ ).

The $d r$ was determined by integrating the olefinic protons in the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ of both diastereomers. The $e e$ was determined by HPLC.

3 ( $70 \mathrm{mg}, 0.38 \mathrm{mmol}, 1$ equiv) was placed in a 20 mL microwave vial and dissolved in 20 mL of HPLC analytical grade EtOH and $\mathrm{RhCl}_{3} \cdot x \mathrm{H}_{2} \mathrm{O}(64 \mathrm{mg}, 0.117 \mathrm{mmol}, 38 \% \mathrm{Rh}, 0.3$ equiv) was added. The vial was sealed and heated at $75^{\circ} \mathrm{C}$ for 4 h .

Six experiments were conducted and after cooling to $23^{\circ} \mathrm{C}$, the combined mixtures were poured on 400 mL of brine and extracted with pentane $(5 \times 400 \mathrm{~mL})$. After drying over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, the solvent was concentrated and the crude residue was purified by column chromatography eluting with pentane $/ \mathrm{Et}_{2} \mathrm{O}$ $50: 1$ to afford 4 as a colorless liquid ( $314 \mathrm{mg}, 1.74 \mathrm{mmol}, 75 \%$ yield) as a 15:1 mixture of 4:3.

The reaction was also performed decreasing the amount of catalyst to $c a .5 \%$ and increasing the concentration. Thus, 3 ( $58 \mathrm{mg}, 0.322 \mathrm{mmol}, 1$ equiv) was placed in a 5 mL microwave vial and dissolved in HPLC analytical grade EtOH ( 5 mL ) and $\mathrm{RhCl}_{3} \cdot x \mathrm{H}_{2} \mathrm{O}(10 \mathrm{mg}, 0.019 \mathrm{mmol}, 38 \% \mathrm{Rh}$, 0.056 equiv) was added. The vial was sealed and heated at $75^{\circ} \mathrm{C}$ for 4.5 h . The work-up and purification were the same as previously stated.

4 was isolated as a colorless oil ( $43 \mathrm{mg}, 0.238 \mathrm{mmol}, 74 \%>97: 3$ mixture of $\mathbf{4}: 3$ ).

## (5R,6R)-5,6-dimethyl-6-(2-methylprop-1-en-1-yl)cyclohex-1-en-1-yl trifluoromethanesulfonate (5)

A solution of distilled diisopropylamine ( $0.35 \mathrm{~mL}, 2.50 \mathrm{mmol}$ ) in anhydrous THF ( 10 mL ) was cooled to $0^{\circ} \mathrm{C}$ and $n-\operatorname{BuLi}(2.5 \mathrm{M}$ in hexane, $1.0 \mathrm{~mL}, 2.50 \mathrm{mmol})$ was added dropwise. After 10 min at $0^{\circ} \mathrm{C}$, the solution was cooled to $-78^{\circ} \mathrm{C}$ and $4(240 \mathrm{mg}, 1.33 \mathrm{mmol})$ was added as a solution in anhydrous THF ( 2 mL ). After 1 h stirring at $-78^{\circ} \mathrm{C}$, a solution of $N$-(2-pyridyl)bis(trifluoromethanesulfonimide) ( $800 \mathrm{mg}, 2.24 \mathrm{mmol}$ ) in anhydrous THF ( 1 mL ) was added. The resulting mixture was allowed to warm to $0^{\circ} \mathrm{C}$ for 1 h and then stirred at room temperature for 16 hours. It was then poured on brine $(100 \mathrm{~mL})$ and extracted with pentane $(5 \times 50 \mathrm{~mL})$. The combined organic layers were washed with brine ( $2 \times 50 \mathrm{~mL}$ ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent removed in vacuo. The crude material obtained previously was dissolved in $\mathrm{MeOH}(2 \mathrm{~mL})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(177 \mathrm{mg}, 1.28$ mmol , theor. 2 equiv) was added. The resulting suspension was stirred at $23{ }^{\circ} \mathrm{C}$ for 5 h (monitored by GC-MS) and poured on half-saturated brine $(100 \mathrm{~mL})$ and extracted with pentane $(5 \times 50 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was concentrated. Purification by column chromatography on silica gel eluting with pentane afforded $\mathbf{6}$ as a pale yellow oil $(90 \mathrm{mg}, 0.48$ mmol, $74 \%$ over 2 steps).

[^2]

A dry 2-neck round-bottom flask equipped with a condenser, was charged with activated magnesium tunings ( $315 \mathrm{mg}, 13.0 \mathrm{mmol}, 1.5$ equiv) that were covered with anhydrous diethyl ether ( 8 mL ). Dibromoethane ( $10 \mu \mathrm{~L}, 4.6 \mu \mathrm{~mol}$, catalytic) was added followed by trimethylsilylpropargyl bromide $(0.5 \mathrm{~mL}, 2.9 \mathrm{mmol}, 0.33$ equiv). The reaction was initiated by warming to reflux. A gentle reflux was then maintained by slow addition of the remaining bromide ( $1 \mathrm{~mL}, 5.8 \mathrm{mmol}, 0.66$ equiv). After addition the mixture was heated to reflux for 20 additional minutes. The Grignard reagent was titrated and used in the following reaction.

A dry Schlenk tube was charged with $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(148 \mathrm{mg}, 0.128 \mathrm{mmol}, 0.2$ equiv) which was suepended in anhydrous $\mathrm{Et}_{2} \mathrm{O}(8 \mathrm{~mL})$. The suspension was stirred vigorously and 5 ( $200 \mathrm{mg}, 0.64$ mmol, 1 equiv) was added as a solution in anhydrous $\mathrm{Et}_{2} \mathrm{O}(2 \mathrm{~mL})$ immediately followed by addition of the solution of Grignard reagent freshly prepared $(0.37 \mathrm{M}, 6.9 \mathrm{~mL}, 2.56 \mathrm{mmol}, 4$ equiv) were added dropwise. The resulting reaction was stirred for 20 h at $23^{\circ} \mathrm{C}$ (monitored by GC-MS). The mixture was poured on brine $(100 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 50 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and the solvent concentrated. The crude material was used in the next step without further purification.

The crude material from the reaction described above (theor. 0.64 mmol , 1 equiv) was dissolved in $\mathrm{MeOH}(1.5 \mathrm{~mL})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(177 \mathrm{mg}, 1.28 \mathrm{mmol}$, 2 equiv) was added. The resulting suspension was stirred at $23{ }^{\circ} \mathrm{C}$ for 6 h (monitored by GC-MS) and then poured on brine ( 50 mL ) and extracted with pentane $(5 \times 30 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$,filtered and solvent was concentrated.
