## 1. Identification and structural elucidation of compounds 1 and 2

General remarks. Organic solvents for fractionation were purchased from Nacalai Tesque. Flash column chromatography was performed using wako gel C-200 (Wako Pure Chemical Industries, Osaka, Japan) and Parallel FR-360 (Yamazen Corporation, Osaka, Japan). The following spectroscopic and analytical instruments were used: ${ }^{1} \mathrm{H}$ and ${ }^{13}$ C NMR, Avance III 400 (reference TMS, Bruker, Germany), HR-ESI-TOF-MS, Waters Xevo G2-S QTof (Waters, Tokyo, Japan). All other chemicals and reagents were purchased from chemical companies and used without further purification.

## Extraction, purification and identification of ( $E$ )-ethyl 3-(4-methoxyphenyl)acrylate

 (1) and ( $\boldsymbol{E}$ )-ethyl 3-(3,4-dimethoxyphenyl)acrylate (2). Dried aerial parts ( 2 kg ) of Kaempferia galanga were extracted with $\mathrm{MeOH}(10 \mathrm{~L})$ for one week at room temperature. After filtration, the filtrate was evaporated to dryness in vacuo at $37^{\circ} \mathrm{C}$ to afford the MeOH extract $(134.4 \mathrm{~g})$. The MeOH extract ( 126.2 g ) of K. galanga was partitioned between EtOAc ( 1.5 L ) and $\mathrm{H}_{2} \mathrm{O}(1.5 \mathrm{~L})$. The EtOAc soluble portion ( 75 g ) was subjected to silica gel column chromatography ( $\phi_{50}$ x 500 mm , Hexane/EtOAc/TFA, 100:0:5 $\rightarrow$ 50:50:5 $\rightarrow$ Hexane/2-propanol, 50:50) to afford seven fractions (A1 ~ A7). A2 fraction ( 56 g ) was recrystallized from Hexane/EtOAc to give ( $E$ )-ethyl 3-(4-methoxyphenyl)acrylate (1, 10 g ). A4 fraction ( 3.9 g ) was separated into eight fractions (B1 ~B8) using silica gel column chromatography ( $\phi 20 \times 500 \mathrm{~mm}$, Hexane/EtOAc/TFA, 6:6:0.5). B2 fraction ( 1.2 g ) was fractionated into nine fractions (D1 ~ D9) using ODS column chromatography ( $\phi 10$ x $300, \mathrm{CH}_{3} \mathrm{CN} / \mathrm{H}_{2} \mathrm{O} / \mathrm{AcOH}$, 10:90:5 $\rightarrow$ 100:0:5). D7 fraction was purified by HPLC with ODS-gel column (Inertsil ODS3, $10 \mathrm{x} \quad 250 \mathrm{~mm}, \quad \mathrm{CH}_{3} \mathrm{CN} / \mathrm{H}_{2} \mathrm{O}, \quad 60: 40$ ) to give ( $E$-ethyl 3-(3,4-dimethoxyphenyl)acrylate (2, 15.4 mg ). ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of (E)-ethyl 3-(4-methoxyphenyl)acrylate and ( $E$ )-ethyl 3-(3,4-dimethoxyphenyl)acrylate were identical to those previously reported. HepG2 or pre-differentiated 3T3-L1 cells were seeded in $100 \mu \mathrm{~L}$ of medium at a density of $1 \times 10^{4}$ cells /well in a 96 well micro-plate. After a 24 h incubation, the cells were treated with test samples for 24 or 48 h . Subsequently, $10 \mu \mathrm{~L}$ of 3-(4,5-dimethyl -2-thiazolyl)-2,5-diphenyl-2H-tetrazolium bromide (MTT; DOJINDO, Kumamoto, Japan) dissolved in PBS at $5 \mathrm{mg} / \mathrm{mL}$ was added. After 4 h incubation, the colored formazan was dissolved in $100 \mu \mathrm{~L}$ of $10 \%$ SDS in PBS. The absorbance at 570 nm was determined using a multi-detection micro plate reader (Powerscan HT, Dainippon Pharmaceutical, Osaka, Japan).

Rosiglitazone exhibits a "U-shaped" conformation, located near the Cys285 residue with its central benzene ring directly behind helix 3 (left) and the TZD head group extending toward helix 12 to form a direct hydrogen bond with the hydroxyl moiety of Tyr473 (right) (B) Structure of the complex between PPAR $\gamma$ LBD and GW9662 (PDB code3B0R) (left). GW9662 forms a covalent bond with the Cys285 residue in the PPAR $\gamma$ LBD (right). (C) Open cavity in the GW9662-bound PPAR $\gamma$ LBD. The potential ligand-binding site is detected by the Molegro cavity detection algorithm and is displayed as a green cavity.
