## EXPERIMENTAL

### Synthesis

**Preparation of NaL0.** Inside the glovebox, **HL1** (0.21 g, 0.67 mmol, 1.0 equiv.) was dissolved in 10 mL of THF. Solid NaH (60%, 0.04 g, 1 mmol, 1.5 equiv.) was added and the mixture was stirred at room temperature for 2 h. The solution was filtered through a pipet plug to remove a white solid. The yellow filtrate was dried under vacuum and then washed with pentane to give a light yellow solid (0.22 g, 0.66 mmol, 98%). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 600 MHz): δ (ppm) = 7.85 (s, 1H), 6.92 (s, 3H), 6.63 (s, 1H), 6.33 (s, 1H), 6.15 (s, 1H), 2.74 (s, 3H), 2.67 (s, 2H), 0.95 (s, 6H), 0.52 (s, 6H). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 150 MHz): δ (ppm) = 167.35, 162.93, 152.00, 150.59, 138.51, 128.18, 123.51, 123.15, 121.10, 110.19, 109.15, 53.93, 28.19, 25.00, 21.83. ESI-MS(–) calc. for C<sub>20</sub>H<sub>25</sub>NO<sub>2</sub> [M–H]<sup>–</sup> = 310.18130, found 310.18100.

**Preparation of aldehyde 1C.** Solid 2,3-dihydroxybenzaldehyde (1.00 g, 7.25 mmol, 1.0 equiv.) was dissolved in 25 mL of DMSO in a Schlenk flask under nitrogen. Small aliquots of NaH (60%, 0.73 g, 18.1 mmol, 2.5 equiv.) were added and the mixture was stirred at room temperature with bromoethyl methoxyethyl ether (1.33 g, 7.25 mmol, 1.0 equiv.) and then stirred overnight. The reaction was quenched by the addition of HCl (aq) and was then extracted into 50 mL of Et<sub>2</sub>O. The organic layer was separated, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and evaporated to dryness. The crude material was purified by silica gel column chromatography (3:2, hexane:ethyl acetate) to afford a light yellow oil (0.58 g, 2.4 mmol, 33%). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz): δ (ppm) = 10.88 (s, 1H), 9.92 (s, 1H), 7.19 (dd, *J*<sub>HH</sub> = 6.2 Hz, *J*<sub>HH</sub> = 1.6 Hz, 1H), 7.15 (dd, *J*<sub>HH</sub> = 6.4 Hz, *J*<sub>HH</sub> = 0.8 Hz, 1H), 6.91 (t, *J*<sub>HH</sub> = 6.4 Hz, 1H), 4.21 (t, *J*<sub>HH</sub> = 4.4 Hz, 2H), 3.88 (t, *J*<sub>HH</sub> = 4.4 Hz, 2H), 3.71 (m, 2H), 3.55 (m, 2H), 3.36 (s, 3H). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100 MHz): δ (ppm) = 196.24, 152.15, 147.44, 125.11, 121.25, 120.79, 119.57, 71.96, 70.81, 69.65, 69.29, 59.08. FT-IR: 2876 (ν<sub>CHO</sub>), 1654 (ν<sub>CO</sub>) cm<sup>–1</sup>. GC-MS calc. for C<sub>12</sub>H<sub>16</sub>O<sub>5</sub> [M]<sup>+</sup> = 240.1, found 240.1.

**Preparation of HL2.** Compound **1C** (0.45 g, 1.88 mmol, 1.0 equiv.) and 2,6-diisopropylaniline (0.33 g, 1.88 mmol, 1.0 equiv.) were dissolved in 5 mL of MeOH. The mixture was treated with 5 drops of acetic acid and then stirred under reflux for 8 h. The resulting clear yellow solution was evaporated to dryness to yield a yellow oil (0.55 g, 1.38 mmol, ~74%). This crude product was used in the preparation of **NaL2** without further purification. Pure **HL2** can be obtained by purification by silica gel column chromatography (1:1 hexane:ethyl acetate). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 600 MHz): δ (ppm) = 13.43 (s, 1H), 8.29 (s, 1H), 7.18 (m, 3H), 7.08 (d, *J*<sub>HH</sub> = 8.4 Hz, 1H), 6.99 (d, *J*<sub>HH</sub> = 6.6 Hz, 1H), 6.88 (t, *J*<sub>HH</sub> = 7.2 Hz, 1H), 4.28 (t, *J*<sub>HH</sub> = 5.4 Hz, 2H), 3.96 (t, *J*<sub>HH</sub> = 4.8 Hz, 2H), 3.76 (m, 2H), 3.60 (m, 2H), 3.39 (s, 3H), 3.00 (m, 2H), 1.16 (d, *J*<sub>HH</sub> = 6.6 Hz, 12H). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 150 MHz): δ (ppm) = 166.85, 151.81, 147.70, 146.10, 138.84, 125.63, 124.40, 123.35, 118.93, 118.66, 117.16, 72.06, 70.92, 69.83, 68.80, 59.19, 28.19, 23.65. FT-IR: 2960 (ν<sub>CNH</sub>), 1620 (ν<sub>CN</sub>) cm<sup>–1</sup>.

**Preparation of NaL2.** Inside the glovebox, **HL2** (5.32 g, 13.3 mmol, 1.0 equiv.) was dissolved in 100 mL of THF. Solid NaH (60%, 1.07 g, 26.7 mmol, 2.0 equiv.) was added. The mixture was stirred at room temperature for 2 h and then filtered to remove the insoluble material. The yellow filtrate was collected and the solvent was removed under vacuum. The crude product was washed with pentane and then dried to yield a light yellow solid (4.03 g, 9.5 mmol, 72%). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz): δ (ppm) = 8.07 (s, 1H), 7.13 (d, *J*<sub>HH</sub> = 6 Hz, 2H), 7.06 (t, *J*<sub>HH</sub> = 6 Hz, 1H), 6.95 (d, *J*<sub>HH</sub> = 5.2 Hz, 1H), 6.71 (d, *J*<sub>HH</sub> = 6 Hz, 1H), 6.15 (t, *J*<sub>HH</sub> = 6 Hz, 1H), 3.88 (s, 2H), 3.33-3.27 (m, 9H), 3.07 (m, 2H), 1.13 (d, *J*<sub>HH</sub> = 4.8 Hz, 12H). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100 MHz): δ (ppm) = 166.39, 165.30, 152.00, 151.17, 139.18, 128.63, 123.28, 122.77, 122.09, 115.75, 106.76, 70.67, 68.10, 67.84, 66.94, 65.98, 58.93, 27.70, 24.15, 15.40. ESI-MS(–) calc. for C<sub>24</sub>H<sub>32</sub>NO<sub>4</sub> [M–H]<sup>–</sup> = 398.23370, found 398.23380.

**Preparation of aldehyde 1D.** Solid 2,3-dihydroxybenzaldehyde (2.3 g, 16 mmol, 1.0 equiv.) was dissolved in 50 mL of DMSO in a Schlenk flask under nitrogen. Small aliquots of NaH (60%, 1.6 g, 41 mmol, 2.5 equiv.) were added and the mixture was stirred at room temperature for 2 h. The resulting dark red solution was treated with triethylene glycol methyl *p*-tosyl ether (5.2 g, 16 mmol, 1.0 equiv.) and then stirred overnight. The reaction was quenched by the addition of HCl (aq) and was then extracted into 50 mL of Et<sub>2</sub>O. The organic layer was separated, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and evaporated to dryness. The crude material was purified by silica gel column chromatography (3:2, toluene:ethyl acetate) to afford a light yellow oil (2.6 g, 9.2 mmol, 55%). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 600 MHz): δ (ppm) = 10.88 (s, 1H), 9.95 (s, 1H), 7.21 (d, *J*<sub>HH</sub> = 8.4 Hz, 1H), 7.17 (d, *J*<sub>HH</sub> = 7.8 Hz, 1H), 6.92 (t, *J*<sub>HH</sub> = 8.4 Hz, 1H), 4.21 (t, *J*<sub>HH</sub> = 5.4 Hz, 2H), 3.89 (t, *J*<sub>HH</sub> = 4.8 Hz, 2H), 3.73 (m, 2H), 3.67 (m, 2H), 3.64 (m, 2H), 3.55 (m, 2H), 3.36 (s, 3H). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 150 MHz): δ (ppm) = 195.29, 151.93, 147.32, 124.09, 121.59, 120.12, 119.37, 71.80, 70.66, 70.73, 70.29, 69.46, 68.83, 58.82. FT-IR: 2871 (ν<sub>CHO</sub>), 1654 (ν<sub>CO</sub>) cm<sup>–1</sup>. GC-MS calc. for C<sub>14</sub>H<sub>20</sub>O<sub>6</sub> [M]<sup>+</sup> = 284.1, found 284.1.

**Preparation of HL3.** Compound **1D** (0.71 g, 2.5 mmol, 1.0 equiv.) and 2,6-diisopropylaniline (0.44 g, 2.5 mmol, 1.0 equiv.) were dissolved in 10 mL of MeOH. The mixture was treated with 5 drops of acetic acid and then stirred under reflux for 8 h. The resulting clear yellow solution was evaporated to dryness to yield a yellow oil (1.0 g, 2.4 mmol, ~95%). This crude product was used in the preparation of **NaL3** without further purification. Pure **HL3** can be obtained by purification by silica gel column chromatography (1:1, hexane:ethyl acetate). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 600 MHz): δ (ppm) = 13.42 (s, 1H), 8.29 (s, 1H), 7.17 (m, 3H), 7.07 (d, *J*<sub>HH</sub> = 7.8 Hz, 1H), 6.99 (d, *J*<sub>HH</sub> = 7.8 Hz, 1H), 6.88 (t, *J*<sub>HH</sub> = 8.4 Hz, 1H), 4.26 (t, *J*<sub>HH</sub> = 4.8 Hz, 2H), 3.94 (t, *J*<sub>HH</sub> = 4.8 Hz, 2H), 3.77 (t, *J*<sub>HH</sub> = 4.8 Hz, 2H), 3.69 (t, *J*<sub>HH</sub> = 4.8 Hz, 2H), 3.66 (t, *J*<sub>HH</sub> = 3.6 Hz, 2H), 3.54 (t, *J*<sub>HH</sub> = 4.8 Hz, 2H), 3.37 (s, 3H), 2.98 (m, 2H), 1.16 (d, *J*<sub>HH</sub> = 7.2 Hz, 12H). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 150 MHz): δ (ppm) = 166.84, 151.85, 147.71, 146.09, 138.84, 125.63, 124.41, 123.34, 118.93, 118.65, 117.26, 72.03, 70.98, 70.75, 70.64, 69.81, 68.82, 59.13, 28.19, 23.64. FT-IR: 2960 (ν<sub>CHN</sub>), 1619 (ν<sub>CN</sub>) cm<sup>–1</sup>.

**Preparation of NaL3.** Inside the glovebox, **HL3** (1.4 g, 3.1 mmol, 1.0 equiv.) was dissolved in 20 mL of THF. Solid NaH (60%, 0.19 g, 4.7 mmol, 1.5 equiv.) was added. The mixture was stirred at room temperature for 2 h and then filtered to remove the insoluble material. The yellow filtrate was collected and the solvent was removed under vacuum. The crude product was washed with pentane and then dried to yield a light yellow solid (1.08 g, 2.3 mmol, 74%). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 600 MHz): δ (ppm) = 8.76 (s, 1H), 7.68 (d, *J*<sub>HH</sub> = 6.6 Hz, 1H), 7.06 (d, *J*<sub>HH</sub> = 7.2 Hz, 2H), 6.97 (t, *J*<sub>HH</sub> = 7.2 Hz, 1H), 6.64 (d, *J*<sub>HH</sub> = 7.8 Hz, 1H), 6.23 (t, *J*<sub>HH</sub> = 7.8 Hz, 1H), 3.95 (t, *J*<sub>HH</sub> = 4.2 Hz, 2H), 3.60 (s, 2H), 3.28-3.20 (m, 11H), 3.09 (m, 2H), 1.13 (d, *J*<sub>HH</sub> = 6.6 Hz, 12H). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 150 MHz): δ (ppm) = 165.02, 161.61, 152.03, 151.54, 138.28, 123.47, 122.58, 122.41, 120.46, 111.72, 107.83, 70.18, 69.31, 68.80, 68.50, 68.22, 65.65, 59.05, 27.78, 23.44. ESI-MS(−) calc for C<sub>26</sub>H<sub>36</sub>NO<sub>5</sub> [M−H]<sup>−</sup> = 442.25990, found 442.26030.

**Preparation of aldehyde 1E.** Solid 2,3-dihydroxybenzaldehyde (1.1 g, 8.3 mmol, 1.0 equiv.) was dissolved in 20 mL of DMSO in a Schlenk flask under nitrogen. Small aliquots of NaH (60%, 828 mg, 21 mmol, 2.5 equiv.) were added and the mixture was stirred at room temperature for 2 h. The resulting dark red solution was treated with tetraethylene glycol methyl *p*-tosyl ether (3.09 g, 8.3 mmol, 1.0 equiv.) and then stirred overnight. The reaction was quenched by the addition of HCl (aq) and was then extracted into 50 mL of Et<sub>2</sub>O. The organic layer was separated, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and evaporated to dryness. The crude material was purified by silica gel column chromatography (1:1 hexane:ethyl acetate to 1:4 hexane: ethyl acetate) to afford a light yellow oil (1.1 g, 3.2 mmol, 39%). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 500 MHz): δ (ppm) = 10.82 (s, 1H), 9.91 (s, 1H), 7.17 (dd, *J*<sub>HH</sub> = 7.5 Hz, *J*<sub>HH</sub> = 1.0 Hz, 1H), 7.12 (dd, *J*<sub>HH</sub> = 8.0 Hz, *J*<sub>HH</sub> = 1.5 Hz, 1H), 6.88 (t, *J*<sub>HH</sub> = 7.5 Hz, 1H), 4.17 (t, *J*<sub>HH</sub> = 4.5 Hz, 2H), 3.84 (m, 2H), 3.69 (m, 2H), 3.64-3.58 (m, 8H), 3.49 (m, 2H), 3.32 (s, 3H). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 125 MHz): δ (ppm) = 196.11, 152.22, 147.50, 125.04, 121.32, 120.86, 119.55, 71.96, 70.91, 70.65, 70.56, 69.66, 69.32, 59.09. FT-IR: 2873 (ν<sub>CHO</sub>), 1655 (ν<sub>CO</sub>) cm<sup>−1</sup>. GC-MS calc. for C<sub>16</sub>H<sub>24</sub>O<sub>7</sub> [M]<sup>+</sup> = 328.2, found 328.2.

**Preparation of HL4.** Compound **1E** (0.43 g, 1.3 mmol, 1.0 equiv.) and 2,6-diisopropylaniline (0.23 g, 1.3 mmol, 1.0 equiv.) were dissolved in 10 mL of MeOH. The mixture was treated with 5 drops of acetic acid and then stirred under reflux for 8 h. The resulting clear yellow solution was evaporated to dryness to yield a yellow oil (0.63 g, 1.3 mmol, 100%). This crude product was used in the preparation of **NaL4** without further purification. Pure **HL4** can be obtained by purification by silica gel column chromatography (1:1, hexane:ethyl acetate). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 600 MHz): δ (ppm) = 13.38 (s, 1H), 8.27 (s, 1H), 7.14 (m, 3H), 7.05 (d, *J*<sub>HH</sub> = 8.4 Hz, 1H), 6.97 (d, *J*<sub>HH</sub> = 7.2 Hz, 1H), 6.85 (t, *J*<sub>HH</sub> = 8.4 Hz, 1H), 4.24 (t, *J*<sub>HH</sub> = 4.8 Hz, 2H), 3.92 (t, *J*<sub>HH</sub> = 4.8 Hz, 2H), 3.75 (m, 2H), 3.67-3.60 (m, 8H), 3.50 (m, 2H), 3.32 (s, 3H), 2.97 (m, 2H), 1.13 (d, *J*<sub>HH</sub> = 6.6 Hz, 12H). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 150 MHz): δ (ppm) = 166.84, 151.83, 147.70, 146.12, 138.76, 125.63, 124.41, 123.32, 118.94, 118.68, 117.30, 72.00, 70.97, 70.69, 70.58, 69.81, 68.85, 59.07, 28.18, 23.64. FT-IR: 2869 (ν<sub>CHN</sub>), 1620 (ν<sub>CN</sub>) cm<sup>−1</sup>.

**Preparation of NaL4.** Inside the glovebox, **HL4** (0.60 g, 1.2 mmol, 1.0 equiv.) was dissolved in 10 mL of THF. Solid NaH (60%, 74 mg, 1.8 mmol, 1.5 equiv.) was added. The mixture was stirred at room temperature for 2 h and then filtered to remove the insoluble material. The yellow filtrate was collected and the solvent was removed under vacuum. The crude product was washed with pentane and then dried to yield a light yellow solid (0.600 g, 1.18 mmol, 96%). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 600 MHz): δ (ppm) = 8.72 (s, 1H), 7.62 (s, 1H), 7.07 (d, *J*<sub>HH</sub> = 7.8 Hz, 2H), 6.97 (t, *J*<sub>HH</sub> = 7.2 Hz, 1H), 6.68 (d, *J*<sub>HH</sub> = 6.6 Hz, 1H), 6.20 (t, *J*<sub>HH</sub> = 7.8 Hz, 1H), 3.98 (s, 2H), 3.65 (s, 2H), 3.50 (s, 2H), 3.44 (s, 2H), 3.39-3.34 (m, 8H), 3.09 (m, 2H), 3.01 (s, 3H), 1.13 (d, *J*<sub>HH</sub> = 6.6 Hz, 12H). <sup>13</sup>C NMR (CDCl<sub>3</sub>, 100 MHz): δ (ppm) = 165.40, 162.08, 152.16, 151.50, 138.30, 123.67, 122.85, 122.68, 122.46, 113.47, 107.82, 71.40, 69.69, 69.04, 69.02, 68.81, 68.62, 68.47, 66.46, 58.80, 27.81, 23.52, 22.56. ESI-MS(−) calc. for C<sub>28</sub>H<sub>40</sub>NO<sub>6</sub> [M−H]<sup>−</sup> = 486.28610, found 486.28650.

**Preparation of LiBar<sup>F</sup><sub>4</sub>.** A 20 mL solution of 3,5-bis(trifluoromethyl)bromobenzene (2.0 g, 6.8 mmol, 5 equiv.) in dry Et<sub>2</sub>O was added slowly using an addition funnel to a Schlenk flask containing magnesium turnings (0.20 g, 8.2 mmol, 6.2 equiv.) in 15 mL of Et<sub>2</sub>O. The mixture was stirred under reflux for 30 min to give a light brown solution. Solid LiBF<sub>4</sub> (0.13 g, 1.4 mmol, 1 equiv.) was added and the reaction was stirred at RT for an additional 48 h. About ~15 mL of 1,4-dioxane was added, which led to precipitation of a large amount of magnesium dihalide. The solvent was removed under vacuum and the reaction flask was brought inside the glovebox for further workup. Inside the glovebox, the product was extracted into Et<sub>2</sub>O and the insoluble material was removed by filtration through a glass frit. The filtrate was evaporated to dryness and the resulting solid was re-dissolved in a minimal amount of Et<sub>2</sub>O and then layered with pentane. Upon storing at -30°C overnight, a large amount of colorless crystals had formed. The crystals were isolated by filtration and dried to afford a white solid (0.74 g, 0.85 mmol, 63%). The NMR spectra of this material were identical to those reported previously.<sup>1</sup>

## Metal Binding Study

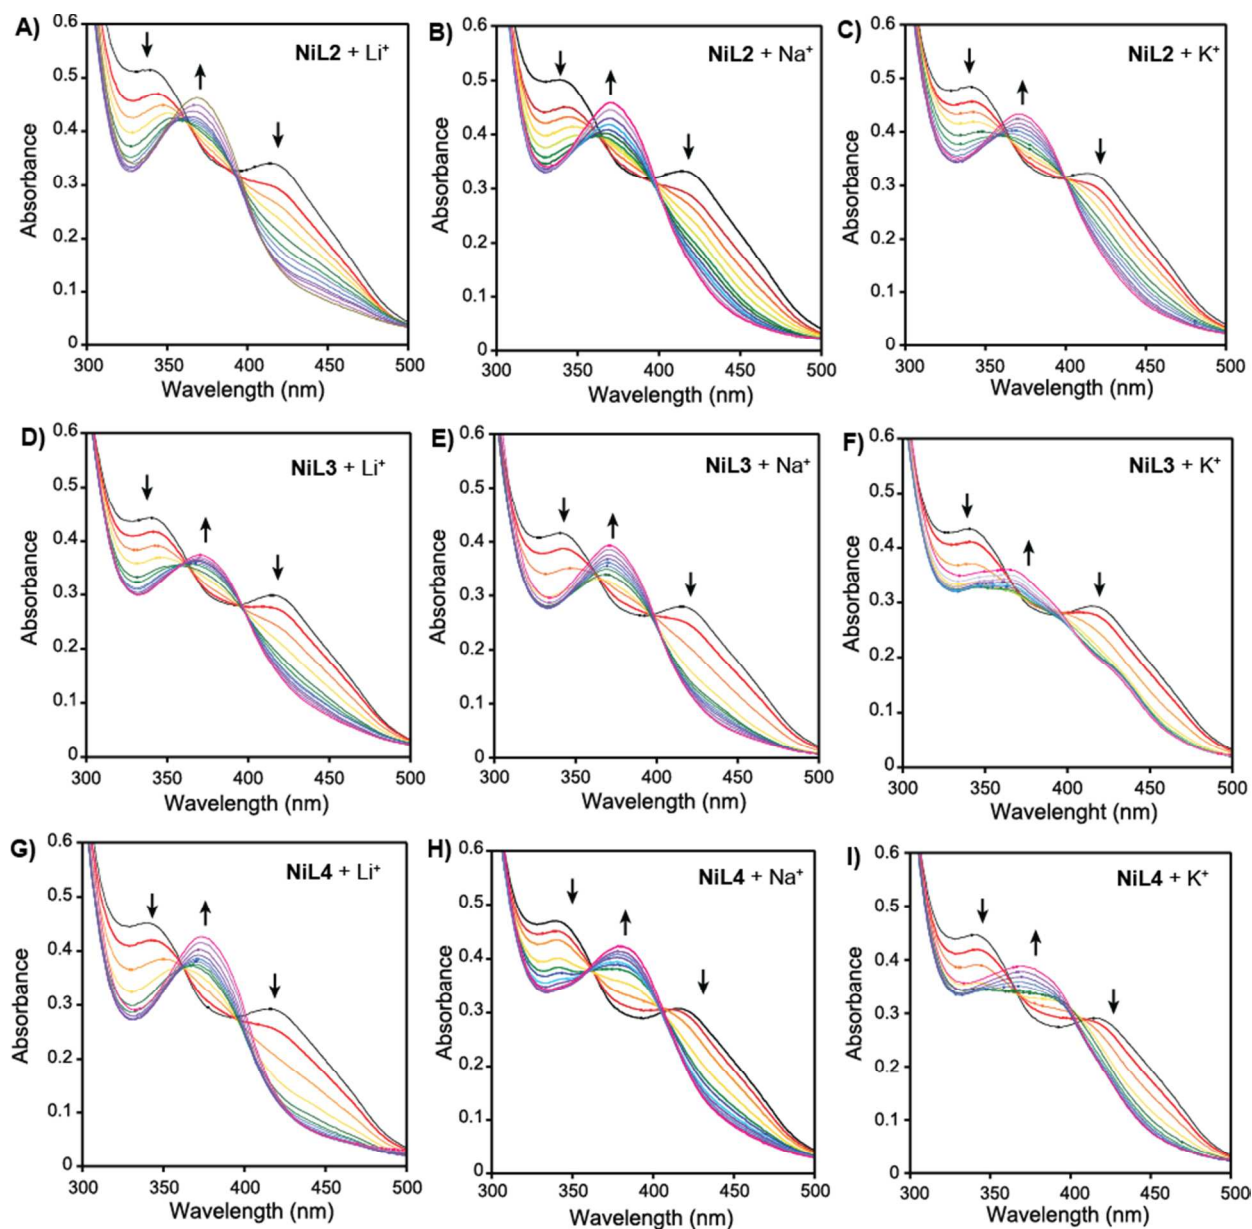

The dilution-corrected spectra obtained from the addition of alkali salts ( $M^+$ ) to solutions of the **NiL** complexes are shown in Figure S1. The program DynaFit<sup>2</sup> was used for non-linear regression fitting of the titration data based on absorbance changes observed at 340 nm. The data were fit to two different binding models, where one model assumes the formation of 1:1 **NiL**: $M^+$  species and the second assumes the formation of a mixture of 1:1 and 2:1 **NiL**: $M^+$  species. In almost in all cases, the latter model gave a better fit than the former based on statistical error analysis. The only exception is the titration data acquired from the addition of  $Na^+$  to **NiL4**, which gave a better fit using a 1:1 rather than a 1:1/2:1 binding model. The Dynafit scripts for the two models used are provided below. Parameters that are allowed to vary in the fitting process are marked with “?” and all other parameters were held fixed.

### A) 1:1 stoichiometry

```
[task]
  task = fit
  data = equilibria
[mechanism]
  Ni + M <==> NiM : K1 association
[constants]
  K1 = .01?
[concentrations]
  Ni = 100
[responses]
  Ni = 0.003 ?
  NiM = 0.001?
[data]
  variable M
  file./Experiments/data.txt
[output]
  directory ./Experiments/output/data
[end]
```

### B) 1:1 and 2:1 stoichiometry

```
[task]
  task = fit
  data = equilibria
[mechanism]
  Ni + M <==> NiM : K1 association
  NiM + Ni <==> Ni2M : K2 association
[constants]
  K1 = .01?
  K2 = .01?
[concentrations]
  Ni = 100
[responses]
  Ni = 0.003 ?
  NiM = 0.001?
  Ni2M = 0.001?
[data]
  variable M
  file ./Experiments/data.txt
[output]
  directory ./Experiments/output/data
[end]
```

**Figure S1.** UV-vis spectral changes observed from the addition of  $\text{MBarF}_4$  ( $\text{M}^+ = \text{Li}^+$ ,  $\text{Na}^+$ , and  $\text{K}^+$ ) to solutions of  $\text{NiL}$  ( $100 \mu\text{M}$  in  $\text{Et}_2\text{O}$ ). Small aliquots containing 0.1 equiv. of  $\text{M}^+$ , relative to  $\text{NiL}$ , were added to  $\text{NiL}$  and the solutions were allowed to equilibrate for 20–30 min before recording the spectra. The titration plots are shown for the following: A)  $\text{NiL2/Li}^+$ , B)  $\text{NiL2/Na}^+$ , C)  $\text{NiL2/K}^+$ , D)  $\text{NiL3/Li}^+$ , E)  $\text{NiL3/Na}^+$ , F)  $\text{NiL3/K}^+$ , G)  $\text{NiL4/Li}^+$ , H)  $\text{NiL4/Na}^+$ , and I)  $\text{NiL2/K}^+$ . The data have been corrected for dilution.

**Figure S2.** The single-wavelength absorption changes at 340 nm observed from the metal titration studies shown in Figure S1. The experimental data are shown as black dots. The data were fit to two metal binding models: the magenta trace represents a 1:1 and 2:1  $\text{NiL}:\text{M}^+$  model whereas the blue trace represents a 1:1  $\text{NiL}:\text{M}^+$  model. In almost all cases, except for  $\text{NiL4}/\text{Na}^+$ , the 1:1 and 2:1 model fits the data better than the 1:1 model. The binding constants  $K_{a1}$  and  $K_{a2}$  derived from data fitting are provided in Table 1. The single-wavelength titration plots are shown for: A)  $\text{NiL2}/\text{Li}^+$ , B)  $\text{NiL2}/\text{Na}^+$ , C)  $\text{NiL2}/\text{K}^+$ , D)  $\text{NiL3}/\text{Li}^+$ , E)  $\text{NiL3}/\text{Na}^+$ , F)  $\text{NiL3}/\text{K}^+$ , G)  $\text{NiL4}/\text{Li}^+$ , H)  $\text{NiL4}/\text{Na}^+$ , and I)  $\text{NiL2}/\text{K}^+$ .

## X-ray Data Collection and Refinement

Single crystals suitable for X-ray diffraction studies were picked out of the crystallization vials and mounted onto Mitogen loops using Paratone oil. The crystals of **NiL2<sub>Mes</sub>**, **NiNaL3**, and **NiKL4** were collected at a 6.0 cm detector distance (40 s/frame exposure time), whereas that of **Ni<sub>2</sub>NaL2<sub>2</sub>** was collected at a 9.0 cm detector distance (60 s/frame exposure time) to prevent diffraction spot overlap due to its large cell size ( $a = 12.0 \text{ \AA}$ ,  $b = 59.9 \text{ \AA}$ ,  $c = 17.3 \text{ \AA}$ ). The structure of **NiL2<sub>Mes</sub>** contains a pentane solvent molecule that is located on an inversion center, which was refined in Part -1 to suppress the generation of special position constraints and by using a site occupancy factor (sof) of 0.5000. Four of the CF<sub>3</sub> groups in the BAr<sup>F</sup><sub>4</sub><sup>−</sup> anion show significant rotational disorder and were refined separately as a two-part disorder using independent variables. The fluorine atoms of the disordered CF<sub>3</sub> groups were fixed to have equal atomic displacement parameters. The structure of **Ni<sub>2</sub>NaL2<sub>2</sub>** has several severely disordered phenyl rings, two of which are attached to P(1) of a triphenylphosphine ligand. These C<sub>6</sub>H<sub>5</sub> groups [C(79)–C(84) and C(85)–C(90)] were modeled as two-part positional disorders. The phenyl group [C(73)–C(77)] that is coordinated to Ni(1) was refined using an AFIX 66 rigid group constraint and its carbon atoms were given equal atomic displacement parameters. The elongated ADPs of the C(73)–C(77) atoms suggest that this group is also disordered, but attempts to model the disorder did not give a stable structure refinement. Four of the CF<sub>3</sub> groups in the BAr<sup>F</sup><sub>4</sub><sup>−</sup> anion were also modeled as positional disorders using independent variables. The crystal structures of **NiNaL3** and **NiKL4** both contain BAr<sup>F</sup><sub>4</sub><sup>−</sup> anions with several disordered CF<sub>3</sub> units, which were also refined accordingly.

**Table S1.** Crystallographic table for **NiL2<sub>Mes</sub>**, **NiNaL3**, **NiKL4**, and **Ni<sub>2</sub>NaL2<sub>2</sub>**
