1. General information

All manipulations were carried out under air atmosphere. Commercially available reagents were used as received without purification. Column chromatography was carried out on silica gel (300–400 mesh). Analytical thin-layer chromatography was performed on glass plates of Silica Gel GF-254 with detection by UV. ^1H and ^{13}C NMR spectra were recorded on a Bruker AVANCE 400M spectrometer. The chemical shift references were as follows: (^1H) CDCl_3 , 7.26 ppm (CHCl_3); (^{13}C) CDCl_3 , 77.00 ppm (CDCl_3). HRMS spectra were carried out at Micromass GCT (TOF MS EI^+). Melting point determination was taken on a Melt-Temp apparatus (X-4) from Beijing Fukai Electro-optic Instrument Plant and was uncorrected.

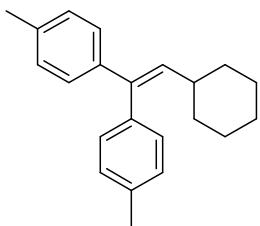

2. General procedure for the cascade radical reaction

A sealable reaction tube equipped with a magnetic stirrer bar was charged with phenyl 3-phenylpropiolate (44.4 mg, 0.2 mmol), DTBP (di-*tert*-butyl peroxide, 0.4 mmol, 74 μL), and cyclohexane (2.0 mL, 10–20 mmol). The rubber septum was then replaced by a Teflon-coated screw cap, and the reaction vessel placed in an oil bath at 120 °C. After stirring the mixture at this temperature for 24 h, it was cooled to room temperature and diluted with ethyl acetate, washed with water, dried over MgSO_4 . After the solvent was removed under reduced pressure, the residue was purified by column chromatography on silica gel (pure hexane) to afford the corresponding product, (2-cyclohexylethene-1,1-diyldibenzene (68% yield).
