**Crystal packing analysis of 3-ferrocenylbenzo[*b*]thiophene (B).** Within the asymmetric unit, a C-H... $\pi$  edge-to-face interaction is observed between the C15–H15 group of the distal Cp ring of molecule **B1** with the benzo[*b*]thiophene of molecule **B2**, the closest contacts being with the C23 and C24 atoms (Figure S1). Specifically, the distances C15...C23 and H15...C23 and the angle C15-H15...C23 are 3.601(4) Å, 2.77 Å and 150°, respectively, whereas the distances C15...C24 and H15...C24 and the angle C15-H15...C24 are 3.744(4) Å, 2.81 Å and 176°, respectively. An additional C-H... $\pi$  interaction is found between the C14-H14 group (distal Cp of molecule **B1**) and the proximal Cp ring of molecule **B2**, for which the distances C14...C33 and H14...C33 and the angle C14-H14...C33 are 3.677(5) Å, 2.50 Å and 153°, respectively.

In the packing mode, a sulfur – aromatic interaction<sup>1</sup> takes place between S2 (molecule **B2**) and the proximal Cp ring of a (x, 1+y, z) symmetry equivalent of molecule **B1**, the S2...C9 and S2...C13 intermolecular distances being 3.495(3) Å and 3.358(4) Å, respectively (Figure S2). Conversely, the S1 atom of molecule **B1** is not involved in any intermolecular contact with aromatic carbons shorter than 3.85 Å. The closest intermolecular contact [3.350(4) Å] between molecules of the same kind (**B2** – **B2**) is found between the (benzo[*b*]thiophene) C27 atom and the (x-1, y, z) symmetry equivalent of the (proximal Cp) C30 atom.
