Synthesis. Compounds **2b-d** and **3b-d** were prepared as per the reported procedures.¹ Synthesis of compounds **2a**, **3a**, **1a-d** are reported in this work. For more details see supporting information.

Procedure for synthesis of tetrakis(hexyl)perylene-3,4,9,10-tetracarboxylate (**3a**)¹

Perylene tetracarboxylic dianhydride (2.5 mmol, 1 equiv.) was dissolved in 30 mL aqueous KOH (13.76 mmol, 5.4 equiv.) solution and stirred at 70 °C for 0.5 h. The solution was filtered and pH value of filtrate was adjusted to 8-9 using 10% HCl. Then Aliquat 336 (0.9 mmol, 0.4 equiv.) and KI (1.4 mmol, 0.6 equiv.) were charged into the solution and then stirred vigorously for 10 min. *n*-Bromoalkane (15.3 mmol, 6 equiv.) was added and the reaction mixture was refluxed for 12 h until a red oil floats on the top and the rest of the solution becomes clear. The reaction mixture was cooled and chloroform (10 mL) was poured into the mixture and filtered through the celite bed to remove unreacted starting material. Celite bed was washed with chloroform. This chloroform layer was separated and washed twice with 15% sodium chloride solution, dried over sodium sulfate and concentrated *in vacuo* to get a viscous concentrate. Methanol was added to precipitate the compound from this concentrate. The solid was precipitated filtered and dried in vacuum. Yield varies from 69-75%.

3a^{1f,g}: $R_f = 0.56$ (10% EtoAc-Hexanes); Yellow solid, yield: 70%; IR (KBr pellet) ν_{max} in cm^{-1} 2953, 2929, 2865, 1730, 1273, 1168; ¹H NMR (600 MHz, CDCl₃, 301.8 K): δ 8.31 (d, $J = 12$ Hz, 4H, H_{Ar}), 8.05 (d, $J = 12$ Hz, 4H, H_{Ar}), 4.32 (t, $J = 6$ Hz, 8H, 4 \times OCH₂), 1.81-1.77 (m, 8H, 4 \times OCH₂-CH₂), 1.47-1.33 (m, 24H, 12 \times CH₂), 0.90 (t, $J = 6$ Hz, 12H, 4 \times CH₃); ¹³C NMR (100 MHz, CDCl₃, 301K): 168.75, 132.84, 130.43, 128.91, 128.71, 121.42, 65.81, 31.76, 28.82, 25.92, 22.79, 14.25.

Procedure for synthesis of tetrakis(hexyl)-1-nitroperylene-3,4,9,10-tetracarboxylate (**2a**)^{2, 1g}

To a solution of perylene tetraester (0.7 mmol, 1 equiv.) in dichloromethane (5 mL), added NaNO₂ (0.7 mmol, 1 equiv.) at 0 °C and stirred. To this well stirred suspension, 69% HNO₃ (3.42 mmol, 5 equiv., 10% solution in dichloromethane) was added dropwise. This mixture was stirred at 0 °C for 1 h. The reaction mixture was poured

into water and extracted with dichloromethane (25 mL). The extract was washed with water and brine. Finally organic layer was dried over anhyd Na₂SO₄ and concentrated. Column chromatography on neutral alumina, using 50% dichloromethane-hexane eluent yielded the desired product. Yields of these nitro compounds were in the range of 80-90%.

General procedure for synthesis of tetraalkyl perylene[1,12-*b,c,d*]thiophene-3,4,8,9-tetracarboxylate (**1a-d**)³

A mixture of compound (**2a-d**, 0.49 mmol) and Sulfur powder (4.95 mmol) was heated to dissolve in *N*-methylpyrrolidone (10 mL) at 70 °C for 30 min and then heated at 180 °C under Ar atmosphere for 17 h. After cooling to room temperature, 2 M HCl solution was added, and the resultant precipitate was filtered, washed with water and dried. The crude product was purified by column chromatography on neutral alumina. Elution with 20-30% DCM-Hexanes mixture followed by 50% DCM-Hexane mixture yields the desired product in 50-60% range.

Relative Quantum Yield Calculation⁴

Relative quantum yield of compound **1b** was measured with respect to tetrakis(octyl)-1H-phenanthro[1,10,9,8]carbazole-3,4,9,10-tetracarboxylate (**4**) in THF solution as the standard, which is having the relative quantum yield of 1 with respect to fluorescein ($Q_f = 0.79$ in 0.1M NaOH)^{1g}. Absolute values were calculated according to the following equation: $Q_s = Q_r \times (m_s / m_r) \times (n_s / n_r)^2$

Where, Q: Quantum yield; m: Slope of the plot of integrated fluorescence intensity vs absorbance; n: refractive index (1.407 for THF).

The subscript R refers to the reference fluorophore *i.e.* compound **4** solution in THF and subscript S refers to the sample under investigation. In order to minimize re-absorption effects, absorbance was kept below 0.15 at the excitation wavelength of 442 nm.

Quantum Yield of compound **4** is 1.01. Simplified equation for the calculation after substituting the appropriate values is given below and values obtained are given in table below.

$$Q_s = 1.01 \times (m_s / m_r) \times (1.407 / 1.407)^2$$

$$= 1.01 \times (m_s / m_r)$$

Entry	m_s	m_r	$Q_s^{a,b,c}$
