## S1. Isolation of $\text{Sc}_3\text{N@C}_{82}$ .

$\text{Sc}_3\text{N@C}_{82}$  was synthesized in a modified Krätschmer-Huffman generator by vaporizing composite graphite rods ( $\Phi 8 \times 150$  mm) containing a mixture of  $\text{Sc}_2\text{O}_3$  (99.99%) and graphite powder with a molar ratio of 1:15 (Sc:C) with the addition of 10 mbar  $\text{N}_2$  into 400 mbar He. The as-produced soot was Soxhlet-extracted by  $\text{CS}_2$  for 24 h, and the resulting brown-yellow solution was distilled to remove  $\text{CS}_2$  and then immediately redissolved in toluene (~200 ml) and subsequently passed through a 0.2  $\mu\text{m}$  Teflon filter (Sartorius AG, Germany) for HPLC isolation.  $\text{Sc}_3\text{N@C}_{82}$  was isolated by three-step HPLC as illustrated in Fig. S1. In the first step, the fullerene extract mixture was isolated by  $20 \times 250$  mm Buckyprep column, and fraction **A** with retention time ranging from 47.5 to 52.3 min was collected (see Fig. S1(a)). In the second-step isolation, the collected fraction **A** was subjected to the recycling HPLC isolation running in a  $10 \times 250$  mm Buckyprep-M column, and fraction **A-1** was collected after two cycles (see Fig. S1(b)). In the third step, fraction **A-1** was further isolated by recycling HPLC using  $10 \times 250$  mm Buckyprep column, resulting in isolation of fraction **A-1-1**, which was further checked by LD-TOF MS measurement as shown in Figure S2.

**Figure S1.** Isolation scheme of  $\text{Sc}_3\text{N@C}_{82}$ . (a) Chromatogram of the fullerene extract mixture obtained from  $\text{Sc}_2\text{O}_3$  with addition of  $\text{N}_2$ . ( $20 \times 250$  mm Buckyprep column; flow rate:  $15 \text{ mL}\cdot\text{min}^{-1}$ ; injection volume: 15 mL; toluene as eluent;  $40^\circ\text{C}$ .) (b) Recycling HPLC chromatogram of fractions **A** isolated from the  $\text{Sc}_2\text{O}_3/\text{N}_2$  extract ( $10 \times 250$  mm Buckyprep-M column; flow rate 5.0 ml/min; injection volume 5 ml; toluene as eluent;  $40^\circ\text{C}$ .) (c) Recycling HPLC chromatogram of fraction **A-1** ( $10 \times 250$  mm Buckyprep column; flow rate 5.0 ml/min; injection volume 5 ml; toluene as eluent;  $40^\circ\text{C}$ ). Inset: Enlarged chromatogram regions highlighting the fractions to be collected for next-step isolation. **A-1-1**:  $\text{Sc}_3\text{N@C}_{82}$ ; **A-1-2**:  $\text{Sc}_3\text{CN@C}_{80}$ ; **A-1-3**:  $\text{Sc}_3\text{CNC}_{82}$ ; **A-2**:  $\text{C}_{92}$ ; **A-3**:  $\text{Sc}_2\text{@C}_{86}$ ; **B**:  $\text{Sc}_3\text{N@C}_{80}$  (I) +  $\text{Sc}_3\text{N@C}_{80}$  (II) +  $\text{C}_{86}$ .

**Figure S2.** Postive-ion laser desorption time-of-flight (LD-TOF) mass spectrum of the isolated  $\text{Sc}_3\text{N@C}_{82}$  (Fraction **A-1-1**). Insets: measured and calculated isotopic distributions of  $\text{Sc}_3\text{N@C}_{82}$ .

### ***S2. Estimation of the relative yield of $\text{Sc}_3\text{N@C}_{82}$ to $\text{Sc}_3\text{N@C}_{80}$ ( $I_h$ ) and $\text{Sc}_3\text{N@C}_{70}$ .***

The relative yield of  $\text{Sc}_3\text{N@C}_{82}$  to  $\text{Sc}_3\text{N@C}_{80}$ - $I_h$  and  $\text{Sc}_3\text{N@C}_{70}$  is estimated based on the integration area of the corresponding peaks in the chromatograms shown in Fig. S1.

**Table S1.** Assignments of each (sub)fraction and their relative abundance.

Fraction	Sub-fraction	Major component	Relative abundance
<b>B</b>	-	$\text{Sc}_3\text{N@C}_{80}$ - $I_h$	79.1%
		$\text{Sc}_3\text{N@C}_{80}$ - $D_{5h}$	13.2%
		$\text{C}_{86}$	7.7%
<b>A</b>	<b>A-1</b>	$\text{Sc}_3\text{N@C}_{82}$ , $\text{Sc}_3\text{CN@C}_{80}$	8.4%
	<b>A-2 + A-3</b>	$\text{C}_{92}$ + $\text{Sc}_2\text{C}_{86}$	91.6%
<b>A-1</b>	<b>A-1-1</b>	$\text{Sc}_3\text{N@C}_{82}$	48.6%
	<b>A-1-2 + A-1-3</b>	$\text{Sc}_3\text{CN@C}_{80}$ , $\text{Sc}_3\text{CNC}_{82}$	51.4%

(1) Given that relative yield of fraction **A:B** is 12.1%:1, the relative yield of Sc<sub>3</sub>N@C<sub>82</sub> to Sc<sub>3</sub>N@C<sub>80-I<sub>h</sub></sub> can be calculated as:

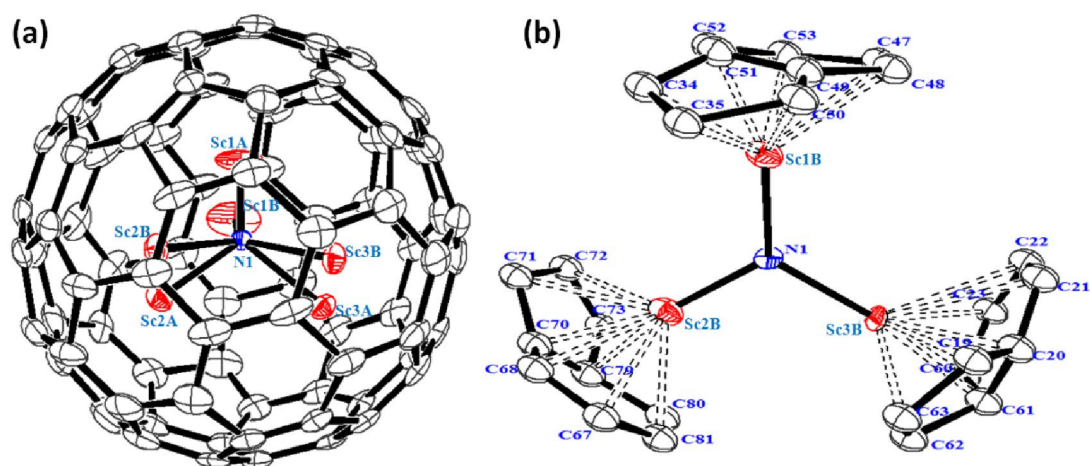

$$\text{Sc}_3\text{N}@C_{82}/\text{Sc}_3\text{N}@C_{80-I_h} = 48.6\% \times 8.4\% \times 12.1\% / 79.1\% \approx 0.62\%$$

(2) In our previous work, the relative yield of Sc<sub>3</sub>N@C<sub>68</sub> to Sc<sub>3</sub>N@C<sub>80-I<sub>h</sub></sub> and Sc<sub>3</sub>N@C<sub>70</sub> to Sc<sub>3</sub>N@C<sub>68</sub> was calculated to be 1:10 and 1.8%:1, respectively.<sup>[S1]</sup> Thus, the relative yield of Sc<sub>3</sub>N@C<sub>82</sub> relative to Sc<sub>3</sub>N@C<sub>70</sub> can be calculated as:

$$\text{Sc}_3\text{N}@C_{70}/\text{Sc}_3\text{N}@C_{80-I_h} = 1.8\% \div 10 = 0.18\%$$

$$\text{Sc}_3\text{N}@C_{82}/\text{Sc}_3\text{N}@C_{70} = 0.62\% / 0.18\% \approx 3.4:1$$

### S3. X-ray crystallographic data of Sc<sub>3</sub>N@C<sub>82</sub>-C<sub>2v</sub>(39718).

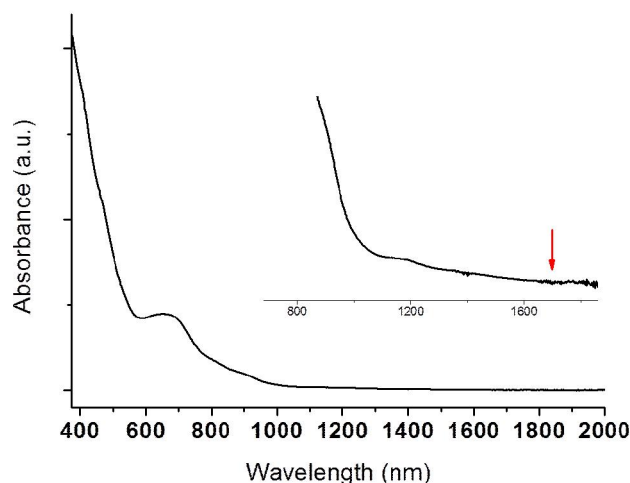

**Figure S3.** (a) Drawing showing the relative position of two Sc<sub>3</sub>N sites inside the C<sub>82</sub>-C<sub>2v</sub>(39718) cage, including the major one composed of Sc1A-Sc3A and the minor one consisting of Sc1B-Sc3B. All atoms are shown in 30% thermal ellipsoids. (b) Position of the minor Sc<sub>3</sub>N site with respect to the nearest carbon atoms of C<sub>2v</sub>(39718)-C<sub>82</sub> cage. C, N and Sc atoms are shown in gray, blue and red, respectively.

**Table S2.** Crystal and structure data of Sc<sub>3</sub>N@C<sub>82</sub>-C<sub>2v</sub>(39718) at 100 K.

Temperature	T = 100 K	Crystal size	0.1 × 0.08 × 0.06 mm <sup>3</sup>
Empirical formula	C131 H56 N5 Ni Sc3	Reflections collected	7517
Formula weight	1890.40	Independent reflections	6807[R(int) = 0.0374]
Wavelength	1.54178	Completeness to $\theta$	98.7% ( $\theta = 70.79$ )
Space group	C 2/m	Absorption correction	Numerical
Unit cell dimensions	a = 25.2209(5) Å b = 15.1985(3) Å c = 19.9181(4) Å $\beta = 94.772(2)^\circ$	Max. and min. transmission	0.71272 and 1.00000
Volume	7608.5(3) Å <sup>3</sup>	Refinement method	Full-matrix least-squares on F <sup>2</sup>
Z	4	Data/restraints/parameters	7517/1075/1034
Density	1.650 g/cm <sup>3</sup>	Goodness-of-fit on F <sup>2</sup>	0.937
Absorption coefficient	3.045	Final R indices [I > 2 $\sigma$ ]	R1 = 0.0721, wR2 = 0.1983
F(0000)	3866	R indices (all data)	R1 = 0.0769, wR2 = 0.2034
Theta range for data collection	3.971 to 70.310 °	Largest diff. peak hole	0.657 and -1.058 e/Å <sup>3</sup>
Index ranges	-23 ≤ h ≤ 30 -18 ≤ k ≤ 18 -24 ≤ l ≤ 23		

**S4. UV-vis-NIR spectrum of  $\text{Sc}_3\text{N}@C_{82}$  in  $\text{CS}_2$  solution.**

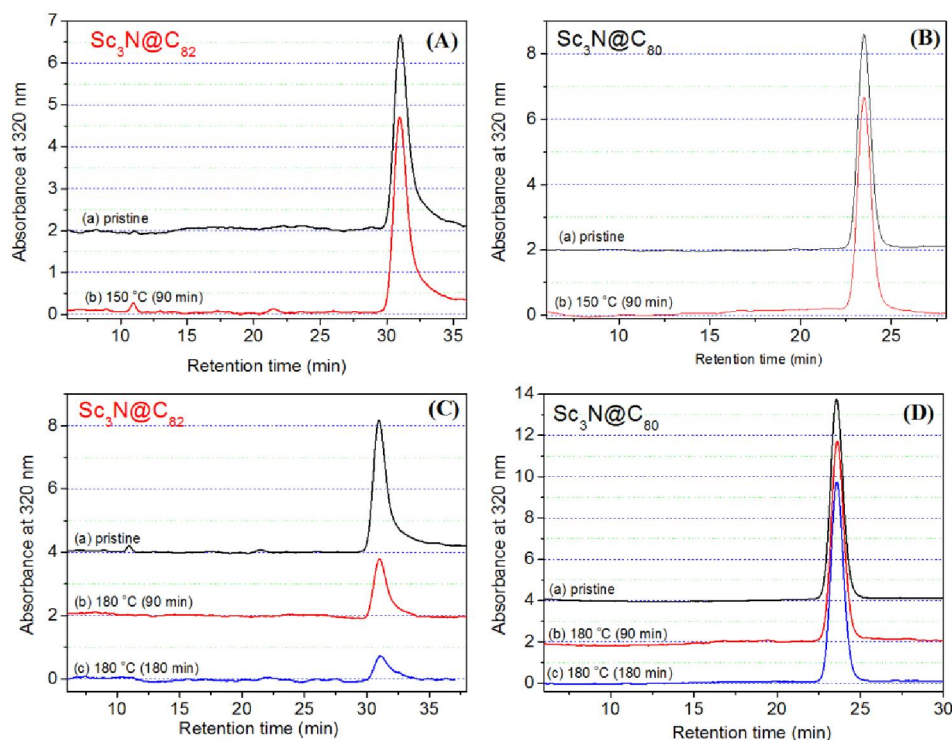

**Figure S4.** UV-Vis-NIR absorption spectrum of  $\text{Sc}_3\text{N}@C_{82}\text{-C}_{2v}(39718)$  dissolved in carbon disulfide. Inset: enlarged spectral range of 680-1860 nm and the red arrow indicated the absorption onset at 1696 nm.

**Table S3.** Characteristic electronic absorption data and optical bandgap ( $E_{g, \text{optical}}$ ) of  $\text{Sc}_3\text{N}@C_{2n}$  ( $2n=68, 70, 78, 80, 82$ ) NCFs.

NCF	Absorption peaks (nm)	Absorption onset ( $\lambda_{\text{onset}}$ , nm)	$E_{g, \text{optical}}$ (eV) <sup>a</sup>	Ref.
$\text{Sc}_3\text{N}@C_{68}\text{-D}_3(6140)$	419, 452, 560, 600, 627, 659, 673, 729, 785, 824, 998	1200	1.10	S2
$\text{Sc}_3\text{N}@C_{70}\text{-C}_{2v}(7854)$	468, 558, 696, 807, 894	960	1.30	S1
$\text{Sc}_3\text{N}@C_{78}\text{-D}_{3h}(5)$	460, 623	1240	1.0	S3
$\text{Sc}_3\text{N}@C_{80}\text{-I}_h(7)$	424, 735	820	1.51	S4
$\text{Sc}_3\text{N}@C_{80}\text{-D}_{5h}(6)$	413, 472	950	1.30	S4
$\text{Sc}_3\text{N}@C_{82}\text{-C}_{2v}(39718)^b$	341, 465, 642, 908	1696	0.73	This work

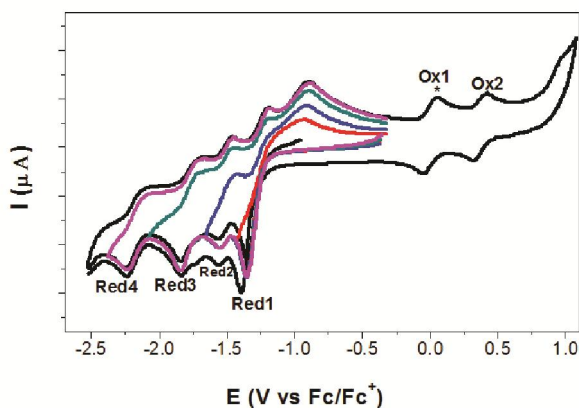

<sup>a</sup> $E_{g, \text{optical}}$  (eV) =  $1240/\lambda_{\text{onset}}$  (nm). <sup>b</sup> $C_{82}\text{-C}_{2v}(39718)$  can be also labeled as  $C_{82}\text{-C}_{2v}(9)$  according to the conventional numbering of the isolated pentagon rule (IPR) isomers based on the Fowler-Monolopoulos spiral algorithm.<sup>S5</sup>

### S5. Thermal stability of $\text{Sc}_3\text{N}@C_{82}$ vs $\text{Sc}_3\text{N}@C_{80-I_h}$

**Figure S5.** HPLC chromatograms of purified  $\text{Sc}_3\text{N}@C_{82}$  (A, C) and  $\text{Sc}_3\text{N}@C_{80-I_h}$  (B, D) solutions in reflux toluene under heating at different temperature in ambient condition. ( $4.6 \times 250$  mm Buckyprep column; flow rate:  $1.6 \text{ mL} \cdot \text{min}^{-1}$ ; injection volume:  $20 \mu\text{L}$ ; toluene as eluent;  $20^\circ\text{C}$ .)

### S6. Cyclic voltammograms of $\text{Sc}_3\text{N}@C_{82}$ in different scanning regions.

**Figure S6.** Cyclic voltammograms of  $\text{Sc}_3\text{N}@C_{82-C_{2v}}$ (39718) in *o*-DCB solution in different scanning regions showing the correlation of each reduction step with the corresponding re-oxidation step. Scan rate:  $100 \text{ mV} \cdot \text{s}^{-1}$ ,  $\text{TBAPF}_6$  as supporting electrolyte. The asterisk labels the oxidation peak of ferrocene, which coincidentally overlaps with the first oxidation peak of  $\text{Sc}_3\text{N}@C_{82-C_{2v}}$ (39718).

**Table S4.** Redox potentials (V vs Fc/Fc<sup>+</sup>) and electrochemical energy gaps ( $\Delta E_{\text{gap, EC}}$ ) of Sc<sub>3</sub>N@C<sub>82</sub>-C<sub>2v</sub>(39718) and Gd<sub>3</sub>N@C<sub>82</sub>-C<sub>s</sub>(39663).

Samples	E <sub>1/2</sub> (V vs Fc/Fc <sup>+</sup> )						$\Delta E_{\text{gap, EC}}$ / V <sup>[a]</sup>	Ref.
	Reduction steps (E <sub>1/2, red</sub> )				Oxidation step (E <sub>1/2, ox</sub> )			
	first	second	third	fourth	first	second		
Sc <sub>3</sub> N@C <sub>82</sub> -C <sub>2v</sub> (39718)	-1.35 <sup>[b]</sup>	-1.52	-1.78	-2.18	0	0.37	1.35	This work
Gd <sub>3</sub> N@C <sub>82</sub> -C <sub>s</sub> (39663)	-1.52 <sup>[b]</sup>	-1.86 <sup>[b]</sup>	-	-	0.37	-	1.89	S6

<sup>[a]</sup>  $\Delta E_{\text{gap, EC}} = E_{1/2, \text{ox}(1)} - E_{1/2, \text{red}(1)}$ ; <sup>[b]</sup> The cathodic peak potential.
