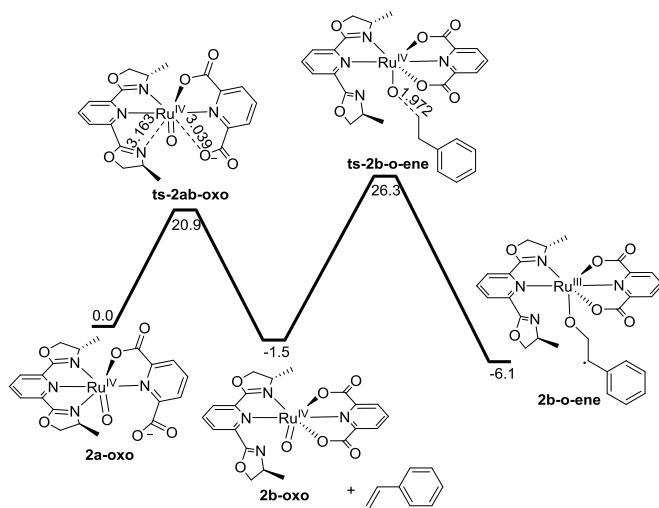

Figure S17. Reaction diagram of epoxidation of styrene using **2b-oxo**. The relative Gibbs free energies are given in kcal/mol, and the bond lengths are given in Å. The activation energy is calculated to 27.8 kcal/mol via **ts-2b-o-ene** when catalyst **2b-oxo** reacting with **styrene**, which implies that it is much slower than the reaction via **ts-trans-2a-o-ene**.

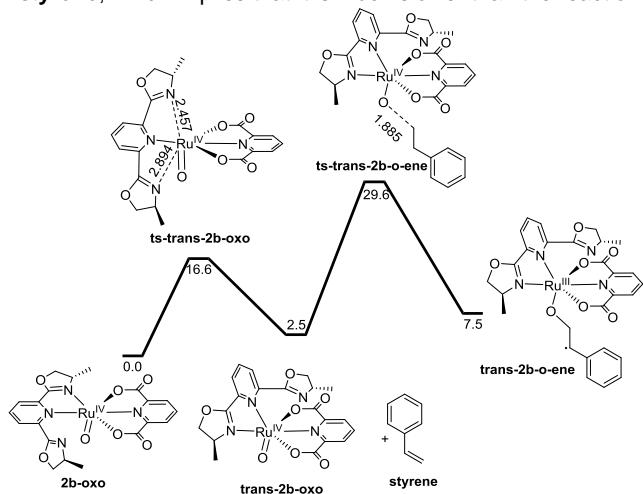

Figure S18. Reaction diagram of epoxidation of styrene using **trans-2b-oxo**. The relative Gibbs free energies are given in kcal/mol, and the bond lengths are given in Å. The free energy barrier of the transition from **2b-oxo** by overcoming **ts-trans-2b-oxo** is calculated to be 16.6 kcal/mol. However, the free energy barrier of the reaction between **trans-2b-oxo** and **styrene** reached 29.6 kcal/mol, which indicates that this pathway would be quite slow.

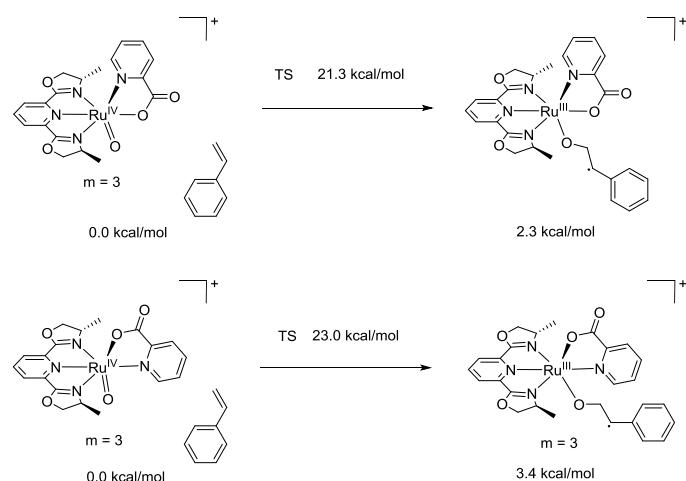

Figure S24. Reaction of two non-carboxylated conformations of **trans-2a-oxo** and **2a-oxo**. The relative Gibbs free energies are given in kcal/mol.

Based on a suggestion from one of the reviewers we calculated the reactivity of the two conformations but with the carboxylate removed. In that way we could distinguish the effect of the carboxylate placement versus the *cis/trans* placement of the picolinate moiety. We found that also here the reactivity is in slight favor of the same conformation that we found more reactive, but the effect is smaller (**Figure S24**). This result indicated that the preference of

reactivity at **trans-2a-oxo** over **2a-oxo** could be due to a combination of the placements of the ligands bound to the metal and the placement of the non-bonded carboxylate group.
