## SUPPORTING INFORMATION: PART A

General: Infrared (FT-IR) spectra were recorded on a Perkin Elmer Spectrum BX spectrophotometer, $v_{\text {max }}$ in $\mathrm{cm}^{-1}$ and the bands are characterized as broad (br), strong (s), medium (m), and weak (w). NMR spectra were recorded on Bruker Ultrashield spectrometer at 400 MHz (for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ) and 100 MHz (for ${ }^{13} \mathrm{C}-\mathrm{NMR}$ ). Chemical shifts are reported in ppm from tetramethylsilane with the solvent resonance as internal standard $\left(\mathrm{CDCl}_{3}: \delta 7.26, \mathrm{CD}_{3} \mathrm{OD}: \delta 3.31\right.$ for ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and $\mathrm{CDCl}_{3}: \delta 77.16, \mathrm{CD}_{3} \mathrm{OD}: \delta 49.00$ for ${ }^{13} \mathrm{C}-\mathrm{NMR}$ ). For ${ }^{1} \mathrm{H}-\mathrm{NMR}$, data are reported as follows: chemical shift, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{dd}=$ double doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{br}=$ broad, $\mathrm{m}=$ multiplet), coupling constants ( Hz ) and integration. High resolution mass spectrometry was performed on Micromass Q-TOF Micro instrument. Optical rotations were measured on JASCO P-2000 polarimeter. Melting points were measured in open glass capillary using ANALAB $\mu$-Thermocal 10 melting point apparatus. Enantiomeric ratios were determined by Shimadzu LC-20AD HPLC instrument and SPD-20A UV/Vis detector using stationary phase chiral columns ( $25 \mathrm{~cm} \times 0.46 \mathrm{~cm}$ ) in comparison with authentic racemic compounds.

Unless stated otherwise, all reactions were carried out with distilled and dried solvents under an atmosphere of nitrogen or argon, oven $\left(120^{\circ} \mathrm{C}\right)$ dried glassware with standard vacuumline techniques. Organic solvents used for carrying out reactions were dried using standard methods. All work up and purification were carried out with reagent grade solvents in air. Thinlayer chromatography was performed using Merck silica gel $60 \mathrm{~F}_{254}$ pre-coated plates ( 0.25 mm ). Column chromatography was performed using silica gel (230-400 or 100-200 mesh). Catalyst IIV were synthesized according to literature procedure. ${ }^{1,2,3}$

A solution of acrolein ( $1.0 \mathrm{~mL}, 15 \mathrm{mmol}, 1.0$ equiv.) in 5 mL MeOH was added drop wise at $-35^{\circ} \mathrm{C}$ over 10 minutes. The resulting solution was stirred at -35 ${ }^{\circ} \mathrm{C}$. After 2 h , the reaction mixture was diluted with 50 mL EtOAc and 50 mL of $\mathrm{H}_{2} \mathrm{O}$. The organic phase was separated, dried over anh. $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo to give the crude 4-nitrobutanal ( $600 \mathrm{mg}, 5.12 \mathrm{mmol}, 34 \%$ yield). The crude product was used in the next step without further purification or characterization.

To a solution of the crude 4-nitrobutanal ( $600 \mathrm{mg}, 5.12 \mathrm{mmol}$, 1.0 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 5.1 mL ) was added 1-(triphenylphosphoranylidene)-2-propanone ( $1.95 \mathrm{~g}, 6.15 \mathrm{mmol}, 1.2$ equiv) at r . t . The resulting solution was stirred at ambient temperature for 24 h . The reaction mixture was diluted with petroleum ether/EtOAc (1:1) and the solid formed was filtered off, washed with petroleum ether/EtOAc (1:1) and the filtrate was concentrated under reduced pressure. The crude product was purified by silica-gel flash column chromatography (15-20\% EtOAc in petroleum ether) to afford $2 \mathbf{l}$ as a colorless oil ( $195 \mathrm{mg}, 1.24 \mathrm{mmol}, 24 \%$ yield). ## General procedure for the preparation of racemic products (rac-3):

In a glass-vial 1 ( $0.050 \mathrm{mmol}, 1.0$ equiv.) and nitroalkane ( $0.200 \mathrm{mmol}, 4.0$ equiv.) was taken with 0.1 mL of $\mathrm{PhCF}_{3}$. To this was added $\mathrm{K}_{2} \mathrm{CO}_{3}(0.100 \mathrm{mmol}, 2.0$ equiv.) the resulting suspension was stirred at r.t. until TLC reveals the complete consumption of $\mathbf{1}$. The crude mixture was purified by preparative TLC (Merck silica-gel $60 \mathrm{~F}_{254}$ pre-coated plates of 0.25 mm thickness) to obtain the racemic desymmetrized products (rac-3).

Typical procedure for the organocatalytic enantioselective $\mathbf{C}\left(\mathbf{s p}^{2}\right)-\mathrm{H}$ methylation:

In an oven-dried Schlenk tube $\mathrm{Na}_{2} \mathrm{CO}_{3}(16.0 \mathrm{mg}, 0.150 \mathrm{mmol}, 1.5$ equiv.) was taken and heated to $150{ }^{\circ} \mathrm{C}$ under high-vacuum for 15 min , cooled to r.t. under vacuum and purged with argon. Catalyst $\mathbf{V}$ ( $5.8 \mathrm{mg}, 0.010 \mathrm{mmol}, 0.10$ equiv.) and 2-benzyl-2-methylcyclopent-4-ene-1,3dione 1a ( $20.0 \mathrm{mg}, 0.100 \mathrm{mmol}, 1.0$ equiv.) was introduced under a positive argon pressure followed by 0.2 mL of absolute $\mathrm{PhCF}_{3}$ and the suspension was cooled to $-10^{\circ} \mathrm{C}$. After 10 min nitromethane ( $54 \mu \mathrm{~L}, 1.00 \mathrm{mmol}, 10.0$ equiv.) was added to it and the resulting mixture was stirred at $-10^{\circ} \mathrm{C}$ until TLC ( $3 \times 5 \%$ EtOAc in petroleum ether) revealed complete conversion of $\mathbf{1 a}(48 \mathrm{~h})$. The reaction mixture was diluted with 2 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and 2 mL of distilled water and slowly warmed to r.t. The resulting biphasic solution was transferred to a 50 mL separating funnel, the organic phase was separated from the aqueous phase. Aqueous phase was extracted with additional $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 5 \mathrm{~mL})$. The combined organic phase was dried over anh. $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure to obtain a reddish-brown oil. The crude reaction mixture was purified by silica-gel flash column chromatography (1-2\% EtOAc in petroleum ether) to obtain 3aa as a crystalline yellow solid ( $19 \mathrm{mg}, 0.088 \mathrm{mmol}, 88 \%$ yield); m.p. $90-91$ ${ }^{\circ} \mathrm{C}$; FT-IR (Thin film): 2926 (m), 1736 (s), 1695 ( s$), 1615$ (m), 1450 (m), 1373 (m), 1255 (m); ${ }^{1} \mathbf{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathbf{C D C l}_{3}\right): \delta 7.14-7.12(\mathrm{~m}, 3 \mathrm{H}), 6.91-6.89(\mathrm{~m}, 2 \mathrm{H}), 6.65(\mathrm{~s}, 1 \mathrm{H}), 2.96(\mathrm{~s}$, 2 H ), $1.84(\mathrm{~s}, 3 \mathrm{H}), 1.23(\mathrm{~s}, 3 \mathrm{H})$; ${ }^{\mathbf{1 3}} \mathbf{C}$-NMR ( $\mathbf{1 0 0} \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ): $\delta 207.7,206.1,160.9,144.5$, 135.9, 129.6, 128.3, 127.0, 52.7, 41.3, 19.3, 11.1; HRMS (ESI+): Calcd. for $\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{O}_{2} \mathrm{Na}$

Typical procedure for the organocatalytic enantioselective $\mathbf{C}\left(\mathbf{s p}^{2}\right)-\mathrm{H}$ alkylation with other nitroalkanes:

In an oven-dried Schlenk tube $\mathrm{Na}_{2} \mathrm{CO}_{3}(16.0 \mathrm{mg}, 0.150 \mathrm{mmol}, 1.5$ equiv.) was taken and heated to $150{ }^{\circ} \mathrm{C}$ under high-vacuum for 15 min , cooled to r.t. under vacuum and purged with argon. Catalyst $\mathbf{V}$ ( $5.8 \mathrm{mg}, 0.010 \mathrm{mmol}, 0.10$ equiv.) and 2-benzyl-2-methylcyclopent-4-ene-1,3dione 1a ( $20.0 \mathrm{mg}, 0.100 \mathrm{mmol}, 1.0$ equiv.) was introduced under a positive argon pressure
followed by 0.1 mL of absolute $\mathrm{PhCF}_{3}$ and the suspension was cooled to $-10{ }^{\circ} \mathrm{C}$. After 10 min , a solution of nitroalkane ( $0.400 \mathrm{mmol}, 4.0$ equiv.) in 0.1 mL of absolute $\mathrm{PhCF}_{3}$ was added to it and the resulting mixture was stirred at $-10{ }^{\circ} \mathrm{C}$ until $\mathrm{TLC}(3 \times 5 \% \mathrm{EtOAc}$ in petroleum ether) revealed complete conversion of $\mathbf{1 a}$. The reaction mixture was diluted with 2 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and 2 mL of distilled water and slowly warmed to r.t. The resulting biphasic solution was transferred to a 50 mL separating funnel, organic phase was separated from aqueous phase. Aqueous phase was extracted with additional $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 5 \mathrm{~mL})$. The combined organic phase was dried over anh. $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure to obtain a reddish-brown oil. The crude reaction mixture was purified by silica-gel flash column chromatography.

## Single crystal X-ray diffraction analysis of 3aa:

A single crystal of 3aa (recrystallized from $1: 1$ petroleum ether/EtOAc at $0{ }^{\circ} \mathrm{C}$ ) was mounted and the diffraction data were collected at 100 K on a Bruker SMART APEX CCD diffractometer using SMART/SAINT software. Intensity data were collected using graphitemonochromatized Mo-Ka radiation ( $0.71073 \AA$ ). The structures were solved by direct methods using the SHELX-97 and refined by full-matrix least-squares on $F^{2}$. Empirical absorption corrections were applied with SADABS. All Non-hydrogen atoms were refined anisotropically and hydrogen atoms were included in geometric positions. Structure was drawn using Olex-2 and ORTEP-3. The crystallographic refinement parameters are given below:
