## Experimental Section:

*Sensitizers.* The syntheses of **NcQ-A**, **C60M-A**, and **ZnP-A** have been reported elsewhere.<sup>1-4</sup> C343 and 1-adamantanecarboxylic acid were obtained commercially (Aldrich), as was the N3 dye (Solaronix) and all were used as received.

*Preparation of Cu<sub>2</sub>O Nanorod arrays.* Cu<sub>2</sub>O nanorod films were prepared as previously described,<sup>5</sup> with changes that included passivation of bare F-SnO<sub>2</sub> areas of the conductive glass substrate, as well as slightly elevated temperature and pH for Cu<sub>2</sub>O deposition. The elevation of pH and temperature was observed to improve the reproducibility of Cu<sub>2</sub>O nanorod growth. ZnO nanorods that were hydrothermally grown on F-SnO<sub>2</sub>/glass substrates pre-seeded with MnOOH nanoparticles in an aqueous bath of ZnSO<sub>4</sub>, ethanolamine and NH<sub>4</sub>OH at 90°C were then subjected to anodic passivation of bare F-SnO<sub>2</sub> via graft polymerization of poly(phenylene oxide).<sup>6,7</sup> Retail fingernail polish, diluted to 15% solution (v/v) in 1,2-dichloroethane/acetone (1:1) was spincoated over the ZnO nanorod films at 2000 rpm for 2 min. Fingernail polish is typically 13-22 wt% nitrocellulose, so the final nitrocellulose solution for spin-casting is estimated at 1-2 wt% nitrocellulose. Polymer-coated slides were then immersed in an aqueous solution of phosphoric acid (0.5 M) or boric acid (0.5 M) and left for 5 min or overnight, respectively. Nanopore membrane-coated substrates were subjected to electrodeposition using the F-SnO<sub>2</sub>/glass substrate as a working electrode, and fitting a glass joint with an o-ring over the substrate with a clamp to make a seal. The glass vessel was filled with an aqueous solution containing lactic acid and CuSO<sub>4</sub>, adjusted to pH 10 with 1 M NaOH (aq). A platinum counterelectrode and Ag/AgCl quasi reference electrode were each fitted into the vessel and wired through a septum used to seal the vessel. The electrolyte was purged with argon through the septum. The vessel was immersed in a water bath at 40°C and electrodeposition was performed cathodically at constant potential (400–600 mV).<sup>8</sup>

*Sensitization of the Cu<sub>2</sub>O films.* Sensitizers were dissolved in anhydrous CH<sub>3</sub>CN (N3, C343) or anhydrous DMF (**C60M-A**, **ZnP-A**, **NcQ-A**) to 1-3 mM concentration, and allowed to soak for 24 h. SEM images were collected before and after soaking (*vide infra*). Upon observation of etching by the N3 dye, an additional film was soaked for just 6 h to assess the etching at shorter time.

*Preparation and testing of photoelectrochemical cells.* Cells were assembled by melt-adhesion of a thin film of Surlyn® polymer between the Cu<sub>2</sub>O/F-SnO<sub>2</sub> electrode and a platinized F-SnO<sub>2</sub> counterelectrode.<sup>9</sup> The cells were filled by capillary action with an electrolyte composed of 0.1 M LiClO<sub>4</sub>, 50 mM methyl viologen tetrafluoroborate, and 25 mM decamethylcobaltocene. After filling the cells with electrolyte, the entry/exit ports were sealed with Hysol 1C epoxy. Current-voltage measurements were done with a Keithley 2400 sourcemeter and solar simulator (SolarLight, Inc.). IPCE spectra were measured against a calibrated silicon photodiode using monochromatic light from a Xenon lamp (PV Measurements QEX7).

## Adamantane-sensitized Cu<sub>2</sub>O

Figure S1. Current-voltage behavior of a photoelectrochemical cell wherein the Cu<sub>2</sub>O nanorod film was sensitized with 1-adamantanecarboxylic acid (from EtOH soln, for 24 h) prior to cell assembly. The decreased photocurrent relative to bare Cu<sub>2</sub>O nanorods suggest that forward electron transport to the methyl viologen has been inhibited by the adamantyl sensitization.

## Adamantane-sensitized Cu<sub>2</sub>O

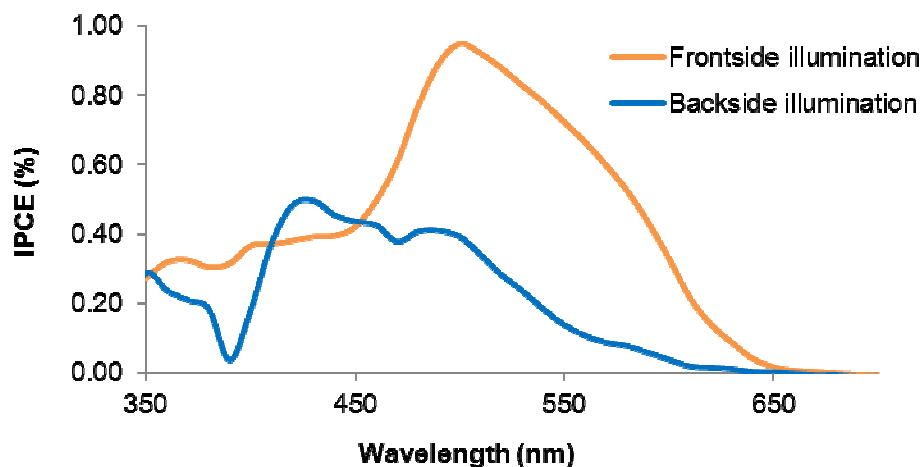

Figure S2. External quantum efficiency behavior of a photoelectrochemical cell wherein the Cu<sub>2</sub>O nanorod film was sensitized with 1-adamantanecarboxylic acid (from EtOH soln, for 24 h) prior to cell assembly.

Figure S3. Device data for PTCDA-coated cuprous oxide nanorods (full voltage range).

Table S1. Device Performance Metrics for Photoelectrochemical Cells using Bare and Molecule-Coated  $\text{Cu}_2\text{O}$  Nanorod films.

Surface coating	Illumination	Active area ( $\text{cm}^2$ )	$J_{\text{SC}}$ ( $\mu\text{Amp}/\text{cm}^2$ )	$V_{\text{OC}}$ (mV)	FF	$\eta$ (%)
<b>ZnP-A</b>	Front	0.60	1760	197	0.28	0.096
<b>ZnP-A</b>	Back	0.60	836	183	0.28	0.043
<b>C60M-A</b>	Front	0.52	1480	175	0.29	0.076
<b>C60M-A</b>	Back	0.52	575	140	0.30	0.024
<b>NcQ-A</b>	Front	0.53	688	140	0.24	0.023
<b>NcQ-A</b>	Back	0.53	299	103	0.26	$7.9 \times 10^{-3}$
<b>C343</b>	Front	0.42	717	102	0.27	0.020
<b>C343</b>	Back	0.42	271	102	0.27	$7.4 \times 10^{-3}$
<b>bare <math>\text{Cu}_2\text{O}</math></b>	Front	0.60	207	81	0.27	$4.6 \times 10^{-3}$
<b>bare <math>\text{Cu}_2\text{O}</math></b>	Back	0.60	140	90	0.28	$3.5 \times 10^{-3}$
<b>N3</b>	Front	0.63	56	124	0.22	$1.5 \times 10^{-3}$
<b>N3</b>	Back	0.63	32	94	0.26	$7.7 \times 10^{-4}$
<b>Adamantane-A</b>	Front	0.61	47	104	0.33	$1.6 \times 10^{-3}$
<b>Adamantane-A</b>	Back	0.61	48	92	0.29	$1.3 \times 10^{-3}$
<b>PTCDA</b>	Front	0.46	-32*	-27*	n/a	n/a
<b>PTCDA</b>	Back	0.46	10	5	0.26	$1.3 \times 10^{-5}$

Front side illumination (through  $\text{Cu}_2\text{O}$ ) is shown in shaded rows. Surface coatings (and bare  $\text{Cu}_2\text{O}$ ) are vertically arranged in descending order of highest to lowest overall efficiency across each given illumination direction. Adamantane-A = adamantane-1-carboxylic acid. \*Device photocurrent broke down before reaching short-circuit conditions.
