## 1. General Information

All experiments were carried out under air. All work-up and purification procedures were carried out with reagent-grade solvents. Analytical thin-layer chromatography (TLC) was performed using E. Merck silica gel 60 F254 precoated plates(0.25 mm) or Sorbent Silica Gel 60 F254 plates. The developed chromatography was analyzed by UV lamp (254 nm). Nuclear magnetic resonance (NMR) spectra were recorded on Varian MERCURY plus-300 spectrometer ( $^1\text{H}$  300 MHz,  $^{13}\text{C}$  75 MHz) spectrometer or a VarianMERCURY plus-400 spectrometer ( $^1\text{H}$  400 MHz,  $^{13}\text{C}$  100 MHz) or a Varian MERCURYplus-500 spectrometer (1H 500 MHz,  $^{13}\text{C}$  125 MHz). Chemical shifts for  $^1\text{H}$  NMR spectra are reported in parts per million (ppm) with the solvent resonance as the internal standard ( $\text{CDCl}_3$ :  $\delta$  7.26 ppm). Chemical shifts for  $^{13}\text{C}$  NMR spectra are reported in parts per million (ppm) with the solvent as the internal standard ( $\text{CDCl}_3$ :  $\delta$  77.0 ppm). Data are reported as following: chemical shift, multiplicity (s = singlet, d = doublet, dd = doublet of doublets, t = triplet, q = quartet, m = multiplet), coupling constant (Hz), and integration. Infrared spectra were recorded on a Perkin Elmer ATR-FTIR spectrometer and are reported in wavenumbers ( $\text{cm}^{-1}$ ). High-resolution mass spectra (HRMS) were obtained from a JEOL JMS-700 instrument (ESI and APCI). X-ray determination was resolved by Rigaku AFC63 four-circle diffractometer. All calculations were performed with Gaussian 09. Molecular geometries were fully optimized with the B3LYP method. The LanL2DZ basis sets with effective core potentials (ECPs) were employed for Pd, and the 6-31G basis set was used for H, C, N, O.

Unless stated otherwise, commercial reagents were used without further purification.

## 2. General procedure of THF-Condition

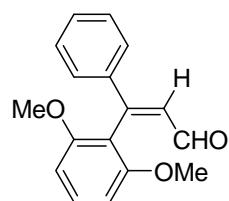

An oven-dried reaction tube was charged with  $\text{PdCl}_2$  (3.54 mg, 0.02 mmol), tri(*p*-tolyl)phosphine (12.16 mg, 0.04 mmol), DCM (1 mL) and MeCN (1 mL) and then stirred for 2 hours. After removing the solvent under vacuum, aromatic acid (**1**, 0.4 mmol),  $\text{AgIO}_3$  (56.56 mg, 0.2 mmol), *trans*-cinnamaldehyde (**2**, 0.2 mmol) and THF (2 mL) were added to the reaction tube. The reaction tube was sealed and heated at 120 °C (oil bath temperature) for 3-24 h (TLC monitored). The black sediment was removing and the filtrate was concentrated in vacuo to give the crude mixture.  $^1\text{H}$  NMR experiment of the crude mixture was performed to determine the Z/E ratios and NMR yields of product (using mesitylene as internal standard). The corresponding pure Z-isomer product was then obtained by purifying the mixture using preparative TLC.

## 3. General procedure of DMF-Condition

An oven-dried reaction tube was charged with  $\text{PdCl}_2$  (3.54 mg, 0.02 mmol), aromatic acid (**1**, 0.4 mmol),  $\text{AgIO}_3$  (56.56 mg, 0.2 mmol), *trans*-cinnamaldehyde (**2**, 0.2 mmol) and DMF (2 mL). The reaction tube was sealed and heated at 120 °C (oil bath temperature) for 0.3-4 h (TLC monitored). The mixture was diluted by EtOAc (20 mL), washed with saturated brine (3 x 20 mL). The organic phase was dried with  $\text{Na}_2\text{SO}_4$  and evaporated in vacuum.  $^1\text{H}$  NMR experiment of the crude mixture was performed to determine the Z/E ratios and NMR yields of product (using mesitylene as internal standard). The corresponding pure E-isomer product was then obtained by purifying the mixture using preparative TLC.

---

It is advisable to attempt to resolve as many as possible of the alerts in all categories. Often the minor alerts point to easily fixed oversights, errors and omissions in your CIF or refinement strategy, so attention to these fine details can be worthwhile. In order to resolve some of the more serious problems it may be necessary to carry out additional measurements or structure refinements. However, the purpose of your study may justify the reported deviations and the more serious of these should normally be commented upon in the discussion or experimental section of a paper or in the "special\_details" fields of the CIF. checkCIF was carefully designed to identify outliers and unusual parameters, but every test has its limitations and alerts that are not important in a particular case may appear. Conversely, the absence of alerts does not guarantee there are no aspects of the results needing attention. It is up to the individual to critically assess their own results and, if necessary, seek expert advice.

#### **Publication of your CIF in IUCr journals**

A basic structural check has been run on your CIF. These basic checks will be run on all CIFs submitted for publication in IUCr journals (*Acta Crystallographica*, *Journal of Applied Crystallography*, *Journal of Synchrotron Radiation*); however, if you intend to submit to *Acta Crystallographica Section C* or *E*, you should make sure that full publication checks are run on the final version of your CIF prior to submission.

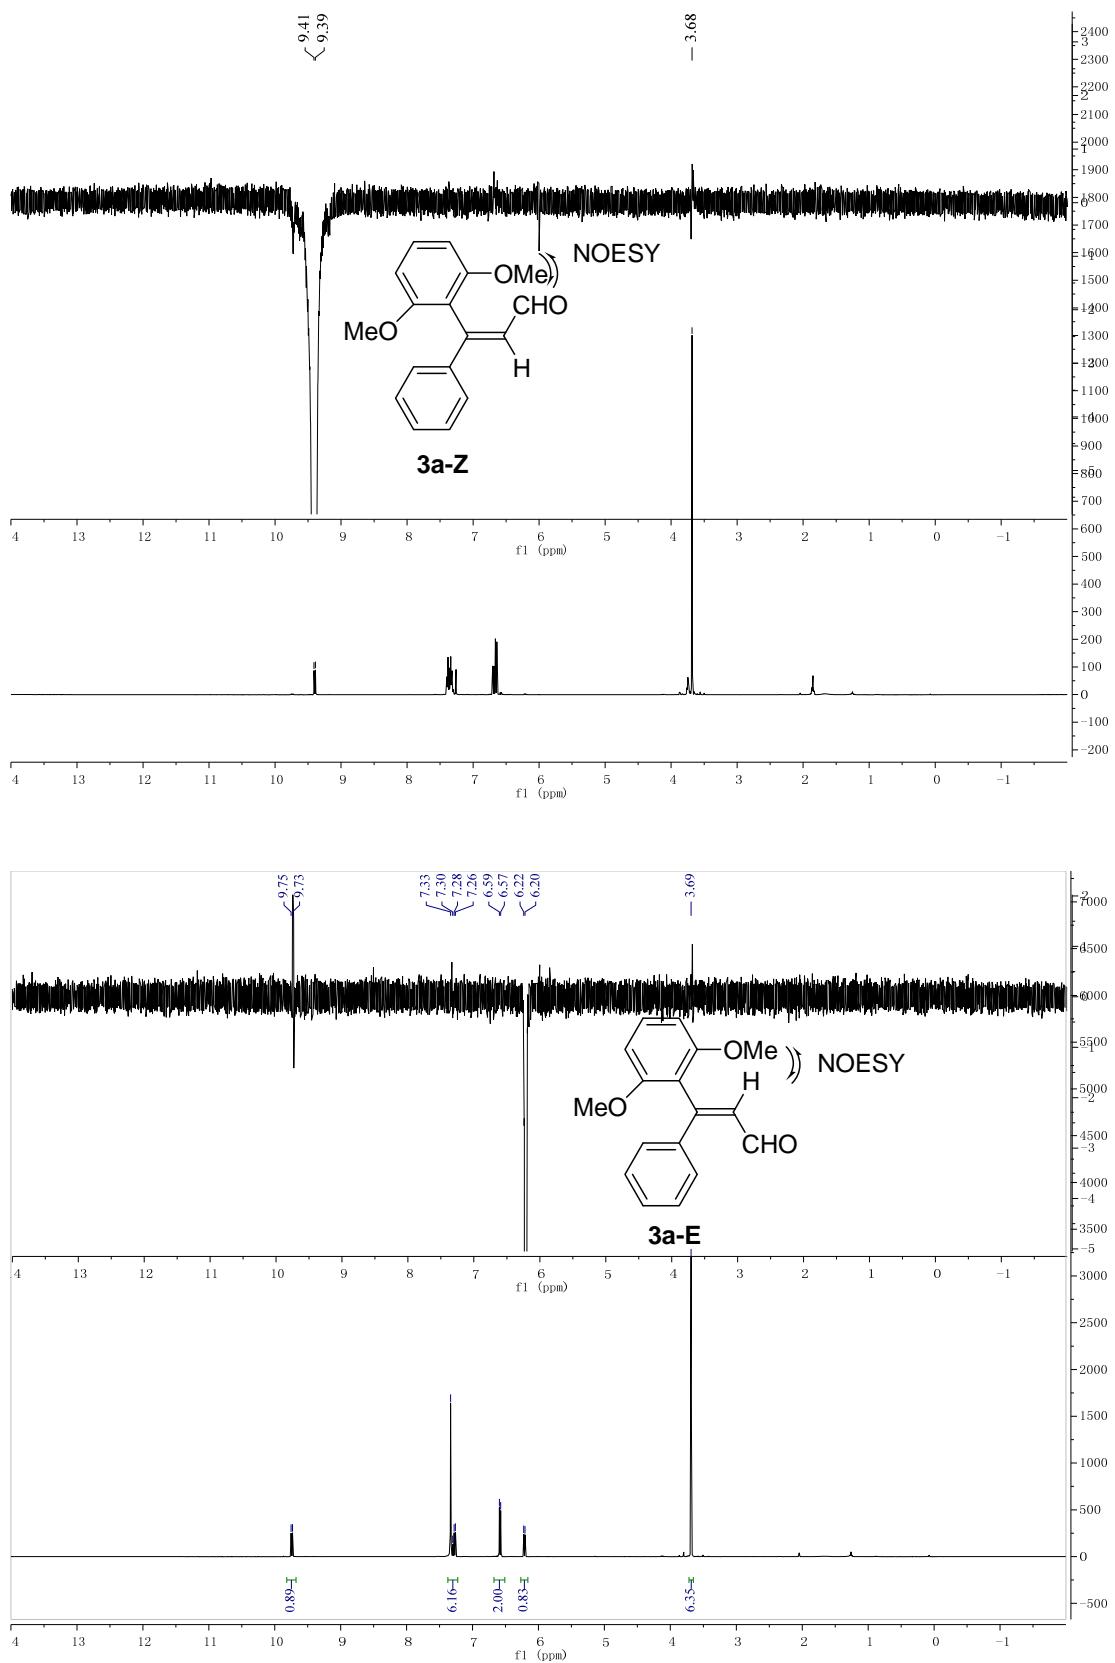

#### **Publication of your CIF in other journals**

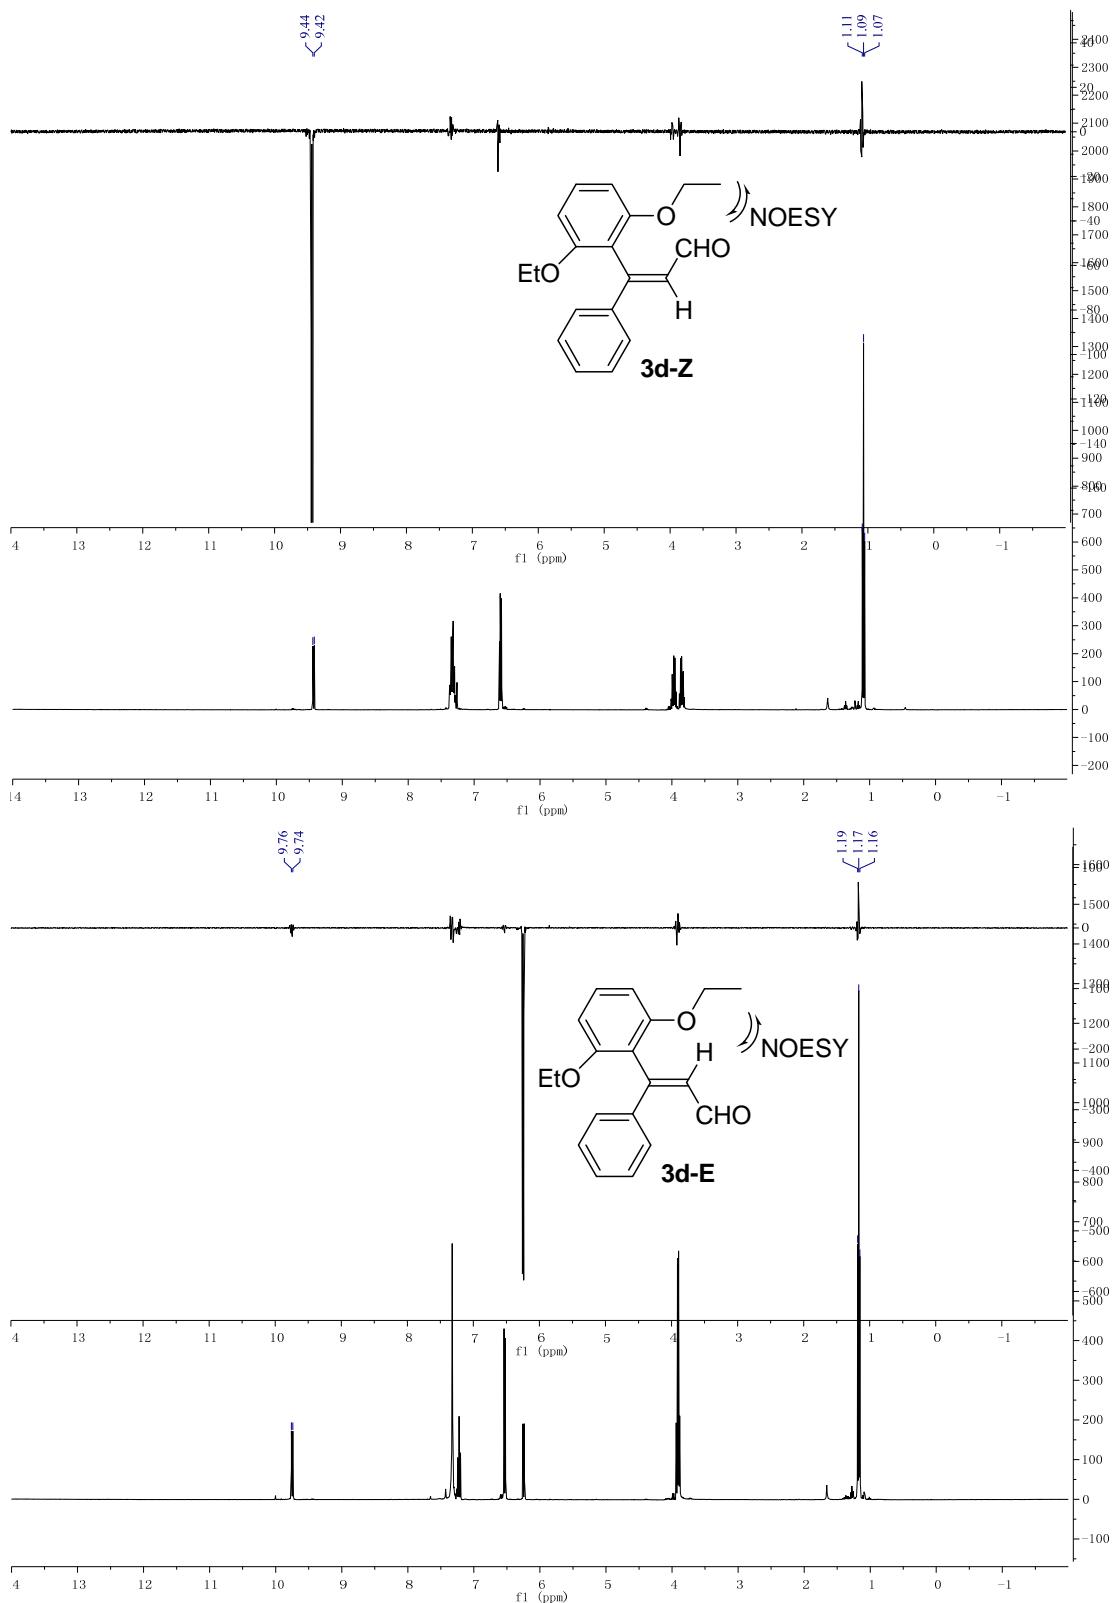

Please refer to the *Notes for Authors* of the relevant journal for any special instructions relating to CIF submission.

## 7. Selected NOESY spectra

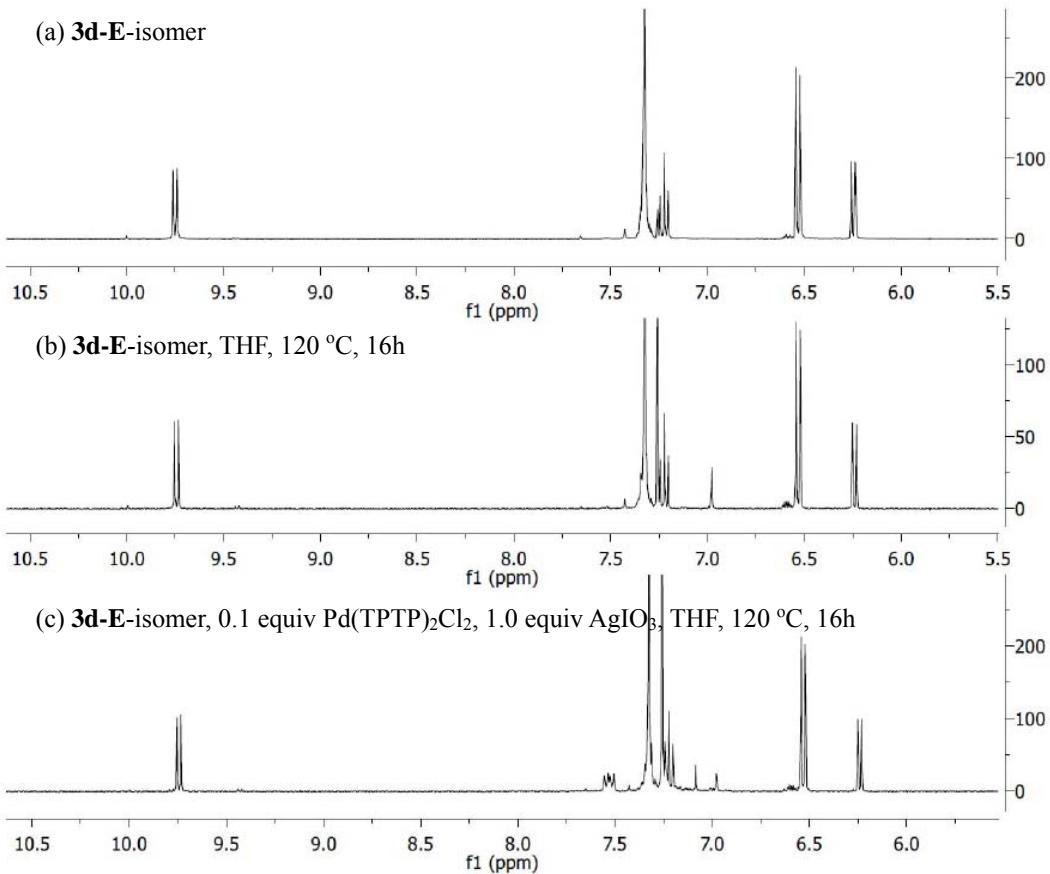

### 8. Selected $^1\text{H}$ NMR spectra of crude reaction mixtures

## 9. Isomerization experiments of 3d-E

## 10. DFT calculations

All calculations were performed with Gaussian 09. Molecular geometries were fully optimized with the B3LYP method. The LanL2DZ basis sets with effective core potentials (ECPs) were employed for Pd, and the 6-31G basis set was used for H, C, N, O.

**11. Other acids that were tested but not effective in this system:**

**12. Experiments using *cis*-cinnamaldehyde as the substrate:**

---

DMF-conditions      **a** (36.4 mg, 2 equiv), **b** (13.1 mg, 1 equiv),  $\text{PdCl}_2$  (1.8 mg, 10 mol %),  $\text{AgIO}_3$  (28.0 mg, 1 equiv), DMF (1.0 mL), 120 °C, 1 h.      NMR Yield = 73 %  
 $Z\text{-c} : E\text{-c} = 14 : 86$

---

THF-conditions      **a** (43.7 mg, 2 equiv), **b** (15.4 mg, 1 equiv),  $\text{PdCl}_2(\text{TPTP})_2$  (9.4 mg, 10 mol %),  $\text{AgIO}_3$  (33.9 mg, 1 equiv), THF (1.0 mL), 120 °C, 24 h.      NMR Yield = 52 %  
 $Z\text{-c} : E\text{-c} = 85 : 15$
