## 1. General information

Unless otherwise noted, all reactions were carried out under an atmosphere of argon in flamedried glassware. Reaction temperatures are reported as the temperature of the bath surrounding the vessel unless otherwise stated. The solvents used were purified by distillation over the drying agents indicated in parentheses and were transferred under argon: $n$-hexane $\left(\mathrm{CaH}_{2}\right)$, THF (Na-benzophenone), toluene $\left(\mathrm{CaH}_{2}\right)$.

Analytical thin layer chromatography was performed on Polygram SIL G/UV254 plates. Flash chromatography was either performed on Merck silica gel (40-63 mesh) by standard technique eluting with solvents as indicated.
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$-NMR spectra were recorded on a Bruker AV 300 or AV 400 , Varian 500 MHz INOVA or Varian Unity plus 600 in solvents as indicate. Chemical shifts ( $\delta$ ) are given in ppm relative to TMS. The residual solvent signals were used as references and the chemical shifts converted to the TMS scale ( $\left.\mathrm{CDCl}_{3}: \delta \mathrm{H}=7.26 \mathrm{ppm}, \delta \mathrm{C}=77.16 \mathrm{ppm}\right)$. ESI mass spectra were recorded on a Bruker Daltonics MicroTof. Specific rotation was measured on a Perkin Elmer 341 polarimeter at $20^{\circ} \mathrm{C}$ using a quartz glass cell ( 100 mm path length). The enantiomeric ratio (ee) was determined by HPLC analysis using chiral column OD-H and AD-H. No attempts were made to optimize yields for substrate synthesis.

## 2. Synthesis and characterization of $\alpha$-chloro $\mathbf{N}$-Boc hydrazones. ${ }^{1}$

2-Chloroacetophenone ( $3.08 \mathrm{~g}, 20 \mathrm{mmol}$ ) and tert-Butyl carbazate ( $2.64 \mathrm{~g}, 20 \mathrm{mmol}$ ) were stirred in ether ( 50 mL ) at RT for 24 h . After this time the product had precipitated as a white solid which was collected and dried to give hydrazone as a white powder.

Other hydrazones were synthesized according to the above procedures.

## 3. Synthesis and Characterization of Products

General procedure for enantioselective synthesis of 3 by formal [4+3] cycloaddition of in situ-derived azoalkenes and enals.

A dried and argon-filled Schlenk flask was charged with hydrazone 2 ( $0.2 \mathrm{mmol}, 1.0$ equiv) and $\mathrm{K}_{2} \mathrm{CO}_{3}(0.5 \mathrm{mmol})$. Then, enal $\mathbf{1}(0.4 \mathrm{mmol})$ was added quickly to the mixture. Subsequently, triazolium salt $5 \mathbf{c}(0.02 \mathrm{mmol}, 10 \mathrm{~mol} \%)$ in 2.5 mL THF was added to the mixture. The mixture was stirred at RT for 16 h . After purification by column chromatography on silica gel (Pentane: Ethyl acetate $=4: 1$ ) the desired product $\mathbf{3}$ was obtained.

Subsequently, triazolium salt $\mathbf{5 c}(184 \mathrm{mmol}, 0.5 \mathrm{mmol}, 0.1$ equiv) in 25 mL THF was slowly added to the mixture. When the reaction was complete, the flask was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the solution was transferred to a round flask and concentrated. The residue was purified by flash chromatography (n-pentane/ethyl acetate $4: 1$ ) to give 0.92 gram of 3ad with $51 \%$ yield and $99 \% e e$.

After 30 min , the reaction was diluted with dichloromethane and transferred to separatory funnel containing saturate sodium hydrogen carbonate solution ( 15 mL ). The organic phase was separated and aqueous phase was extracted with dichloromethane ( $3 \times 15 \mathrm{~mL}$ ). The organic phases were combined and solvent removed in vacuo.
