Experimental Section

General: Reactions were carried out in oven-dried glassware under nitrogen atmosphere. All commercial reagents were used without purification, and all solvents were reaction grade. *N,N*-Dimethylacetamide, *N,N*-dimethylformamide, 1-methyl-2-pyrrolidinone, dimethyl sulfoxide was freshly distilled from calcium hydride under nitrogen. All indium, copper iodide, copper chloride, palladium catalysts, and lithium chloride were purchased from chemical companies and used directly without further purifications. All reaction mixtures were stirred magnetically and were monitored by thin-layer chromatography using silica gel pre-coated glass plates, which were visualized with UV light and then, developed using either iodine or a solution of anisaldehyde. Flash column chromatography was carried out using silica gel (230-400 mesh). ^1H NMR (400 MHz) and ^{13}C NMR (100 MHz) spectra were recorded on NMR spectrometer. Deuterated chloroform was used as the solvent, and chemical shift values (δ) are reported in parts per million relative to the residual signals of this solvent (δ 7.26 for ^1H and δ 77.2 for ^{13}C). Infrared spectra were recorded on FT-IR spectrometer as either a thin film pressed between two sodium chloride plates or as a solid suspended in a potassium bromide disk. Mass spectra were obtained from the KBSI on high resolution mass spectrometer. Melting points were determined in open capillary tube using Electrothermal 9100 apparatus.

Pd-catalyzed cross-couplings of phosphoryl alkylindiums with aryl bromides:

General procedure A (4aa, 4al – 4ap, 4ar, 4fe)

Diethyl phenethylphosphonate (4aa)^{2a} : To an test tube was added diethyl (2-bromoethyl)phosphonate¹ (171.5 mg, 0.70 mmol), indium (160.8 mg, 1.4 mmol), CuCl (138.6 mg, 1.4 mmol), and THF (3.0 mL) sequentially. The reaction was stirred at 65 °C for 12 h. Then, it was concentrated under vacuuo. The residue was dissolved in DMSO (1 mL) and transferred to another test tube. Pd₂(dba)₃ (22.89 mg, 0.025 mmol), CyJohnphos (35.1 mg, 0.1 mmol), LiCl (21.2 mg, 0.5 mmol), and iodobenzene (71.4 mg, 0.35 mmol) was added to the test tube sequentially. The reaction mixture was stirred at 70 °C temperature. After 3 h, the reaction mixture was filtered and then, concentrated in vacuuo. The residue was subjected to flash column chromatography on silica gel (ethyl acetate:hexane = 1:1) to give diethyl phenethylphosphonate (67.0 mg, 79%).
